Once we get there and dub a Planet " ATARI ",Then we really can call
ourselves ATARIANS. :-) I am sure TuneSmith Music will be playing thru
the spacestations everywhere (Processed with PVG of course)

happy new year as well.

2. Boxkite problem

Newsgroup: comp.sys.atari.st
Date: 2001-01-01 00:36:18 UTC
From: "Martin \"Nightowl\" Byttebier" <tos4ever@online.be>
Message-ID: <3a4fd6a89def03@online.be>
Source record: 52484

Hello,

I encountered a very strange Boxkite. For some reason Boxkite doesn't
display the time. It displays something like this

2001wishes.mpg 1.119.423 12

It should be 2001wishes.mpg 1.119.423 31.12.2000 18:41

It makes no differents if I use 2.15 or 2.13. Also if I delete the
current boxkite.inf I still can't see the time.

For your information I'm doing this on a Hades 060 running freeMiNT
1.15.10b/N_AES 2.0.0., novaVDI 2.7, NVDI 5.03. I'm a registrated user but
I only use it very occasionaly.
OTOH on my TT030 using the same OS but in monochrome the time is
displayed.

Anyone an idea about this?

GrafTool certainly does convert JPG to GIF. Right-click the image and select 'Konvert'; choose '256 Farben' (or less) and then call up the remapping options dialog ('Methoden'). Set the dithering ('Rasterung') and palette options and click 'OK'. Floyd-Steinberg dithering along with Octree or Median-Cut variations work the best.

Or you can simply use the 'Datei' dropdown menu and 'Sichern als' (Save as) GIF, which will use default, configurable remapping options.

If I remember correctly, the unregistered version of GrafTool will allow only one GIF conversion per session. Also, some of the program's features will depend on your graphics mode.

For the 2600, What type of computer was used to actually program the games
on?
the computers back then must of been quite basic and it couldn't of been a
ibm compatible because they didn't exist back in the 70's did they ??

does anyone know what language is used to program with that console ??

and how is the data actually put on the chip in the cartridge ??

please fill me in :)

>I try to open Gemini . tos with no luck on mt STe.

Just by double-clicking on them!

It's possible that this is a self extracting archive, so it might
be useful to rename the file (select it, go to "Show Info" in the
"File" menu of your desktop) with a ZIP extender instead of TOS.
Then you might be able to extract the files with STZIP.

The only reason to have that CPX installed was to set the serial port speed
of a (very) few progs which weren't capable of setting their own. Indeed I
find that StiNG is one of these!

>Now this is interesting. So far I always have used serial.cpx a I
>thought it was necessary. Indeed STik 2 runs happy without the cpx. I

The baud rate is set explicitly in one of the configuration files.

You'll be fine with this, unless and until you need to change speed to
something else.

Hi Neil,

as usual I talk crap, but only half crap, problem here was, I work in TC
and of course JPGs usually have more colours than the 256 that as far as
I know GIF is limited to. Result is that clicking on 'save as' in TC
just gives TIf, PCX and PNG as possible. Yes as you say, map down to 256
or operate in 256 colours and JPG to GIF is possible with Graftool.
Sorry,

Bob

AFAIK, no. As said I using Boxkite not very often.

>I would just
>fiddle around with the settings of Boxkite and see if it can be fixed. On
>your desktop, are the times displayed??

Which settings? I'm using exactly the same settings on both machine. On
the TT030 everything seems normal but on the Hades I don't see the time
attributes. I tried almost every possible set up. Geneva, plainTOS
with just a minimun of auto prg and acc, delete bkite.inf, etc.. Nothing
helped. Every other fileselector I tried, including the stone old UIS III,
does display the timestamps correct. Only Boxkite does not. Weird.

Yes, I see the correct time on taskbar or clock.cpx.

Hi Edward,

try changing the protocol from http to ftp in CAB URL. For best
download, 8 mins, I had to use AFTP as stand alone and call up the root
directory ftp.jvgames.com You will find other games there as well.

Bob King.

You can not open them. They are executable programs, which only can be
started, but not opened. If you want to look in them, you would need a
dissassembler or at least a binary editor. But if I think about your
question, I think this makes no sense for you ;-)

Hi,

is it just possible that what you are talking about is a self extracting compressed file. I wonder, as although it's many years since I used Gemini desktop, I don't remember it as a TOS file, but as a PRG.

Bob King.

30. AtariWorks overlay

Message-ID: <B67690D8.39A5%jlpinson@dundee.net>
Source record: 52564

If anyone here has a copy of the American version of AtariWorks and
would be willing to make a copy of one small file for me -- the AMERICAN.OVL
-- please e-mail me.
Recently, I posted a message about a problem I was having getting my
AtariWorks to run. Jerry Martin in this group has kindly helped me isolate
the problem to the AMERICAN.OVL file, which apparently went bad on the disk.
Unfortunately, he has the British version of the program, and it turns
out if you run AtariWorks with the British OVL file, it won't read the
American dictionary and thesaurus files, even if you rename them to the
British equivalent.
I'm not trying to pirate any software here -- I just need an uncorrupted
copy of the one file bad on my legal copy of the program. So if you have
this and would be willing to help, I'd appreciate it.
Thanks.

Every new computer is designed by using its predecessor. Both hardware and
software. In the 70's they used one of the many big mainframes, I guess.
It is the old chicken and egg question. :-)

While the techies are designing the hardware, the software guyes already have a
emulator running.

On my machine they appear to be stored in a file called
COOKIES.DAT in the same directory as CAB itself. Planning on doing some
sort of parsing of this information?

Dan

Hi Michael,

>>Unless Milan gets his act together these numbers probably will not rise
>>significantly... Milan makes me think of Atari, great at R&D but lousy at
>Right. However, I would not guess that you can get 500+ buyers for a *new*
>machine under that conditions.

I agree, but then the posting was merely ment as a "what if.." excercise.
Nevertheless it should be clear by now that because of the lack of dealers a
lot of *potential* customers are not reached and are simply left in the dark.
If the tradional channels don't really work, it might be time to try direct
approach and try to sell the machines by direct marketing via internet. Since
it wouldn't mean a large investment on the part of Milan, why not give it a
go? every board sold could be regarded as a pure bonus....
Ofcourse I don't expect 500+ buyers, but considering that it took over two
years to find 500 customers, 250 a year. Suppose 50 people would buy one via
this scheme, it would ment a 20% boost of sale figures, without hardly any
costs at all. It would cost a little more sending the boards via UPS, but then
Milan can keep the dealers profitmargin in their pocket, so it probably would
work out to cost more or less the same....

Is 50+ buyers an overrated estimate? if it is then I can only say that Milan
is in the wrong line of business, considering that there are 75+ prospective
buyers for vapourware like the CT-60 and that people here just melt away
whenever the name Tempest is mentioned....

>The Milan Bootblock, TOS and utilities can be set to english and german (and
>the default is english!). TOS supports additional languages and keyboards,
>but due to a lack of interest, the RSC files for the desktop may not be
>completely translated. At least french should be useable
Yes I know all this, however I don't think that a lot of Milan users are
working under TOS. Once that N.AES or MagiC is running the English TOS is of
no use anymore. We (DDP translations) offered to translate the whole package,
but Milan never even bothered replying, I for one will not sit on my knees
and beg them, all it takes for them is a simple mail.....
Axro did contact us regarding the English translation for the Milan2, but as
you know this project sadly.... :-(

What I ment was that selling a computer with only an English TOS simply isn't
good enough... *everything* that comes with the computer should be in English,
meaning the programs, docs, manuals etc... I realise this normally is the job
of the distributor, but since there isn't a distributor...
Have you ever bought a calculator or VCR that came with nice useless Spanish

and Japanese manuals? not a word German in there... well then you should know
the feeling....

Cheers from Belgium
Dennis

Hi Dennis,

>Well that would explain why Gemulator doesn't see it. Thanks...
Just adding my two cents...
You haven't explained why you need to run Gemulator with MagiC-PC, I suppose it's because you want to run some programs that don't like MagiC?

MagiC-PC can load a TOS image file and will then look and behave just like a stock Atari... this feature is undocumented, but it works.
You need to make a TOS image file (TOS.IMG) and rename it to ROM.OS, copy it to the root directory of MagiC-PC and reboot... whenever you like to run the real MagiC just rename ROM.OS to ROM.OSX.

Cheers from Belgium

<snipped the whole lot>
>but if you had taken the time you would have noticed that the chip we're
>talking about uses the 603e core. Even the 603 could not be nearly as slow
>as the '060, though.)
Oh but I *did* check it... "The Motorola processor product guide 1997" is
good enough for me....

>Motorola disagrees, which you could easily have found out if you'd taken
>a few minutes to look up some facts.
I've learned over the years to take benchmarks with a grain of salt, and
especially when these are supplied by the manufacturer...
Motorola seems to hold benchmark tests that differ each time... in 1997 the
603ev/200Mhz was rated a 195 MIPS, so over the years it seems to magically
become some 40% faster, the 68060/60Mhz was rated at 130 MIPS three years ago
in the "Motorola processor product guide 1997", that one has lost some 10% of
it's power....
I suppose these figures changing from year to year is because they test the
603 with newer and faster motherboards with faster RAMs and cache. A Motorola
motherboard in 1997 managed 40Mhz, how much is it now? 100? 133? None of this
applies to the Falcon ofcourse. I rather stick with the 195 MIPS figures from
1997, the 68060/75Mhz probably is good for 145 MIPS... still a difference,
but a lot smaller...

>Now, step over to the 68000 page and you'll see that Motorola only
>claims 110 MIPS for that (presumably also Dhrystone 2.1). They don't
>say if that is for the 50, 60, or 75 MHz version, but it would be rather
>unusual to specify such numbers for other than the top performer.
To put it bluntly: in my book all this benchmark number crunching is strictly
for the fanatics.... I like "the everyday use" benchmarks a lot better, i.e
how long will it take Photoline to rotate a 10MB TIFF, how long does is take
before POV finishes a complex object, how much megabytes can LZH pack in 10
minutes... etc, these are examples that show the real power of the computer,
and not only what the processor is capable of, and anyone can easily compare
the figures with his current setup.

>Obviously, the first time a program is run no translation has been done,
>so the processor must spend time on that. Next time it won't have to.
Sorry, but my simple mind can't grasp this, would you care to explain this
with some more details? I'm sure others here are puzzled as well ....
If the processor can "remember" it must store this information somewhere, only

place I can think of is the harddisk... I'm probably wrong because retrieving information from such slow media would only cost time...

>The neat thing with an 'Atari' with a PPC is that you'd still have the
>same OS etc as with the 68k machines. There should be very little need
>for rewriting anything (except assembly stuff, obviously).
My simple mind can't grasp this either.... do you mean that TOS will run in native PPC-mode? what about MiNT and MagiC? will the Tempest card feature an adapted TOS version?

Cheers from Belgium
Dennis

>thingies...
Unless you're thinking of writing a super duper browser, don't bother, it
might surprise you, but the Atari internet clients are just as good as the
stuff you're using on the PC.
In fact some of "our" clients will beat the shit out of the PC crap :-)

Hm... isn't Philips sold under the Magnavision label in the U.S ?

>Uhh... didn't catch that. The connection on the back of the PowerCD
>is like a 6-pin DIN (circular pattern). I connect my STfm to a TV
>with either a RCA cable (from the modulator) or a 13-pin DIN ST monitor
>connector.
Sorry, I assumed you lived in Europe... the European model seems to have a
seperate RF modulator which is lacking on the US model.
The 6-pin DIN connector is present as well, the Power CD and the Philips
model both came with a cable for this, one end plugs in the 6-pin DIN while
the other end has a SCART connector, this connector can be found on most
TV's and VCR`s, but IIRC this kind of connector isn't very popular either
in the States....

Cheers from Belgium

Hi John,

>Papillon does have an English RSC (separate download)!
>Are GIF animations supposed to "animate" within the program?
>They don't in the demo.
Yes... go to the options menu and select "file parameters" when there's a
animated GIF in memory, you'll be able to "play" it...
When you load an animated GIF, you'll see in the toolbox just behind the
rubber stamp how many layers it contains, pressing the up and down arrows
will take you through the whole animation as well, but this option is ment
to edit or add/delete the layers/frames...

For additional help/info just mail me...

>> waiting for better things to come.... :-(
>
>Not entire sure what you are getting at.
Here in Belgium there's a saying: the grass on the other side of the hill is always greener.. that's where I was getting at. Ever since Atari released the MegaST, Atari users have been waiting for "the next machine", when the TT was released some were waiting for the expanded model featuring a tower and Unix, when the Falcon was released some were waiting for the model with a 68040 and graphic card to appear....
At the moment there are two alternatives for the aging TT and Falcon, I would have thought that the specs of these machines are enough to make *any* Atari user drool, but no..they drool over vapourware, can someone who put his name on the CT-60 list explain me why this is a much better alternative then for example a Milan?
How can a Falcon with all his hardware limitations be superior by just banging a faster processor in it? by pure magic? poor graphics, slow harddisk access by today standards, no easy way to connect ethernet card etc...

Instead of bying what is available *now* and supporting the people that have developed the Hades and Milan in difficult times all they get is a truckload full of shit over their heads. How that anyone can expect them to develop and release a new and more powerfull computer in this climate is beyond me. A new project costs heaps of money, since no one wants to buy their existing "crap" they can't generate any money from the previous project, can you imagine what a bankmanager his reaction is looking at Hades or Milan?

If we all keep postsponing the moment to upgrade our ST's, Falcs and TT's the day will come that there's nothing out there to upgrade to, simply because the alternatives have all filed for chapter 11.

This is the only platform that has such "weird" users... PC, Apple, Amiga and even Acorn users couldn't wait to get there hands on the latest model, but we sticked to the ST... Atari made that darn machine just too good. And now we're faced with the consequences... 90% of the existing software is written to run on the ST, there's hardly anything that takes advantage of the superior power of the successors.

We're all crying out loud for a new browser that can handle at least anything the browsers on the other platforms can manage, but at the same time we also expect it to run on minimum a stock 4Mb Falcon.... think about it, a statement like this is enough to make a normal person ROTFL, but we are very serious about it. Not a week passes here without someone asking how to go on internet with a 1040ST, we all are keen to help and explain, never have I seen someone giving the advice to throw the machine out and upgrade to something more suited...

Ah shit... why do I even bother,
Am I really the only one here who thinks differently?
It's been a long day... time to go and see if my bed is still there.

Cheers from Belgium
Dennis

Hi Dennis,

Do I detect the tan fading :))

Yes, I agree with all you say above. In many ways the Atari ST was too
innovative for the long term good of Atari. I've told many times here of
the many instances I've cited Atari hardware or software prior art
against some very big names indeed. Atari had it first, but then had not
sufficient marketing/footprint to do anything about it. Couple this with
the abysmal management by Atari and there you have it. I think that the
days when a die hard Atarian could say 'my atari is as good as your PC'
are long gone even for the MIDI man and the only reason for holding onto
a basic ST or even a Falcon, is nostalgia. That's not to say that the
design of the Falcon and ST were not genius in their day, but that day
is past. It's hard I know to say to the hundredth enquirer of 'How do I

connect my ST to the Internet', 'Don't waste your time, all you can hope for is very slow, no graphics, pages, if you're desparate to access the web get a second hand 486 for ï¿½200', but it's the sad truth. That just leaves the 'super Ataris', the only one of which I have any knowledge being the Milan. When running correctly :)) (in joke) this is a superb computer. Sure, it's a lot slower than the latest PC, but coupled with NAES/MINT/MING or Magic/Jinnee, it has a working presentation that is far better than Windows/PC and on a par with the much dearer Mac platform. I can access the Web with Cab 2.7 as fast and sometimes faster than with my work PC. But can we buy a Milan? The Milan home page has been unchanged for weeks, in spite of their pledge after the Milan II fiasco. I think that they still have Milan Is in stock, but you wouldn't know it!!!! Have they a death wish? Your suggestion about direct buying from Milan of the kit and the finished computer, is brilliant. Joe Conners, from whom I bought my Milan, built it from the kit and it was an easy plug and play job (with one hitch, remedied by Milan over the phone). I want a SCSI and sound card for my Milan. Can I get one in the UK? you must be joking! The Milan and Hades? are here and are the only sure way foreward, but for X sake get your bloody finger out Milan.

Bob King.

Source record: 52593

Sheesh... what planet do you live on??
As you may notice my site is an Atari ST emulation site. Come down off your high horse and face reality. The Falcon and all other Atari computers are DEAD!! The ONLY thing that is keeping them alive is the renewed interest brought about by the internet and the dedication of thousands of die-hard fans. No commercial software company is going to produce programs for such a tiny niche market, virtually all of the recent software is shareware written by fellow enthusiasts. If you can write a half decent programme for the Atari then your only chance of making some cash is to duplicate it for the PC market. I've wrote dozens of programs for the ST (when it was in it's zenith), all were shareware and the sum return of my effort was ZERO. If all sites similar to mine were removed, it would do even more damage to the Atari community. I've heard from hundreds of Atari fans who have gone out and bought secondhand ST/STe's simply because of the availability of software, the number of Atari Webpages and the multitude of FREE emulators that are now available. Piracy is rife in the PC market but the enormous number of potential customers still make software production a viable commercial proposition.

If we follow your idealist viewpoint - pray tell me who do I pay my money to for a game/application that's 10~15 years old, produced by a company that no longer exists? You tell me the name of one computer owner with 100% legitimate, fully-paid software and I'll call you a liar!! I've worked with computers for 20 years and I've yet to see one that has no expired shareware or 'borrowed' programmes on it. Come back to earth!

Tellme

63. Eclipse was: CT2B FLASH

Newsgroup: comp.sys.atari.st
Date: 2001-01-02 14:35:22 UTC
From: Sven Karlsson <svenka@it.kth.se>
Message-ID: <3A51E72A.CDF8537F@it.kth.se>
Source record: 52594

Hi All,

> A very good question. The makers of the Eclipse graphics card reckon that
> that will run with a CT2B once it (the graphics card adaptor) is fitted
> with the appopriate through connectors.

I have never claimed that for sure. However, Rodolphe Czuba do claim
that the CT2B works with the Eclipse and you might have thought that
these claims were from me. I have answered those who asked that I belive
it would work though.

However, I have since got bugreports that indicates that some CT2 work
with the Eclipse and some don't. I have also received bugreports that
two Falcons with different (rather old) CPU accellerators do not work
with the Eclipse.

The Eclipse do not alter the timing of the Falcon bus at all. It was
designed from the bus timing specifications released from Atari and
68030 and 68000 bus specifications from Motorola. The Falcon bus part of
the Eclipse worked from the very first day on stock Falcons, afterburner
Falcons and also Nemesis. But I do make errors every now and then. I'm
very interested in getting in touch with anyone experiencing problems
with Eclipses that might originate from the hardware. All logic on the
Eclipse can be updated by software given a rather simple cable so as
long as I can get in direct contact with people having problems I can
send possible updates directly to them.

Now for some shameless plugging: :-) An ethernetdriver for PCI cards
based on the RealTek 8029 chip is coming. The driver will be free and
open source but you will of course need an Eclipse... ;-)

Best Regards
Sven Karlsson / Istari Software

Consider once a network card... a Riebl Card works fine with STinG on a
ST.

> I would like to share the Internet between my PC and my Atari OVER SERIAL
> LINE. In the ideal case, only the raw data is transported over this line.

> stuff (?) and a working configuration (ahem...this might be the hardest
> one, folks!).

What do you mean with only RAW DATA ? If you want to use FTP and all
those things you'll have to use TCP-IP...

You'll need a null-modem cable to connect ST and PC with a serial line.
Software : STinG on the ST with a correct routing table (i.e. all
traffic going to internet must be routed to the IP address of the 2nd
serial port of your PC (the serial port which is connected to the
atari).
On the PC you'll need a dummy modem driver to connect to your ST over
the serial line. Also a Network Address Translation Program will be
needed on you window$ box, unless you have two different IP addresses
assigned by your ISP (Doubt that). BTW don't know if this will work fine
(two dial-up networks on the PC). Maybe some-one else can give you more
advise about this.

Small remark from me : why don't you use the ST as router/gateway... no
NAT software will be needed, since STinG does IP masquarade.

Check these pages out, not the same setup as yours, but it can give you
some ideas :

Sounds strange for someone to inform us they had to use a Mainframe to program
a 2600......astonishing.

Hi there,

> CH>They've forgotten to add Yamaha 8424S, which also works nicely...

Has anyone tried a 8824?

I can only find the above 8424 drive and 8824 but they do an external version of the 8824 which would be nice, if these units work well then I may get one as I can get them for £126, £144 (internal) and £188 (external) respectively (+ VAT though).

What Software and version are people using and who supplies it (in the UK)?

Thanks

Mark

Ok, I follow you now. I was in "wait" mode for a long time. I know
this very well. It is like a trap, or it was when Atari was still open,
but now that new models don't just appear, you would think it would
change.

> At the moment there are two alternatives for the aging TT and Falcon, I would

> example a Milan?

Good question. I've never purchased any upgrade that require "soldering"
on any machine I've ever owned. I prefer a whole new machine. My
opinion is that if I have to live with limits or compatibility problems
why not go that extra mile for a whole new machine? That is why
I bought the Hades. My reason for waiting was lack of a local dealer
and the fear of getting took from an over-seas dealer, or if a problem
came up... and so on.

> How can a Falcon with all his hardware limitations be superior by just banging
> a faster processor in it? by pure magic? poor graphics, slow harddisk access
> by today standards, no easy way to connect ethernet card etc...

Perhaps such motivation is pure cost? Cost is never an issue for me
once I set my mind to something. Most people don't think that way I
guess. You have to wonder if the cost of an 060 chip is so high, it
seem to me the chip alone will cost nearly as much as the board logic.

> Instead of bying what is available *now* and supporting the people that have

I agree. Don't wish to put you on the spot but do you have a Milan or
Hades? Plan to get one if not?

> If we all keep postsponing the moment to upgrade our ST's, Falcs and TT's the
> day will come that there's nothing out there to upgrade to, simply because
> the alternatives have all filed for chapter 11.

That's probably what will happen. It amazes me how some people hold out.
Probably get hate mail, but anyone using an 520ST and a mono monitor these
days is either nuts or dirt poor. Granted it may have uses, but I've seen
some users over the years who expect far to much from such a system.

> This is the only platform that has such "weird" users... PC, Apple, Amiga and

> faced with the consequences... 90% of the existing software is written to run
> on the ST, there's hardly anything that takes advantage of the superior power
> of the successors.

Some of that is due to developement packages that are now no longer
supported. In order to get an 060 compiled app what does one need?
If I am correct in thinking only GCC and such can do this?

> We're all crying out loud for a new browser that can handle at least anything
> the browsers on the other platforms can manage, but at the same time we also
> expect it to run on minimum a stock 4Mb Falcon.... think about it, a statement

> with a 1040ST, we all are keen to help and explain, never have I seen someone
> giving the advice to throw the machine out and upgrade to something more
> suited...

That is a strange situation indeed. Personally it's my feeling that
unless one really bites the bullet and gets a Hades, Milan, or similar
upgrade, it seems like a silly request. CAB on my plain TT with images
"ON" is barely usable in my opinion. If CAB did "it all" it would
probably come to a near halt and not be useable.

> Ah shit... why do I even bother,
> Am I really the only one here who thinks differently?

I tend to think differently, usually I get flack for it.
I still think the bar needs to be raised, when it comes to coding
new apps. How high should the bar be? There is a can of worms
so I won't give my opinion. ;-)

> It's been a long day... time to go and see if my bed is still there.

I was just joking about your sig. Actually, I do alot of
gfx coding in such when I'm not tinkering on aIRC. Some of my
projects bring my poor TT to a near stand still. The Hades
although fast is dam nice, but some tasks can always benifit
from more speed, hense my interest in PPC.

I have the same problem, it appears wrong on my Hades and correctly
on my TT. Strange. My Hades setup is nearly identical, except
for an older kernal and Rage NVDI v5.01. The TT is in 16 colors
when I checked.

btw, I can't find any info what was changed in boxkite 2.15.
Any idea?

Yes sorry I had problems wording that and my erratic use of speech marks probably did not help. I meant that there are a number of STE MoBo layouts but all of them had 2 ROM chips in more or less the same place, unlike some other STs which may have been 2, 4 or 6 (or whatever it was) ROM chips placed anywhere you like.

I think 1.6, 1.62 and even 2.06 all fit on the same size chips.

Mark.

Hi,

This is Alex from O'WONDER, the folks behind BiT BOPPER. We released BiT BOPPER in 1993 as an all-in-one system based on the Atari Falcon, known as 'SONOVISTA'. In 1995, when Atari stopped making the Falcon, and then went out of business themselves, we left the BiT BOPPER software online for fans to download.

Somehow, recently, one or more of the files has become corrupted. Due to the fact we have NO Falcons on hand (we had to sell the last one a long time ago to an enthusiastic and desperate customer) and the small Falcon market, we don't support BiT BOPPER any more. However, we're in talks with some people in Greece who may take over BiT BOPPER for Falcon (their copy works fine), and if you want to be notified when the files will be available again, please let us know at <bitbop@owonder.com>.

We are sorry for any problems, which we were unaware of until hearing from some of you.

We're amazed and grateful that 7 years after BiT BOPPER was made available, that it is still creating interest!

Regards,

Alex

Hi All,

I have burnt my fingers and dented my bank balance by buying a top of the range HP950C colour printer. Surprise, surprise there are very few of my programs that can drive it in any way. GrafTool can and gives photo-quality prints. I can either keep it until I give in and buy a PC (with MagicPC I hasten to add) or cut my losses and sell it. So for a mere ï¿½100 +PP its yours. As I say, unless you know something I don't (very possible!!) it's no bloody good for the Atari range (yes I've tried ALL the lower number HP drivers for all the programs I want), but for a PC it's the bee's knee-caps.
I'm in S. Wales, Abergavenny, or Newport for cheaper collection.

BTW HP don't have any drivers for Atari for download and I'm too embarrassed to phone!!

Bob King.

Yes I had the same problems. I usualy check every archive prior to
upload but as it was a Falcon only program I didn't this time.
I've removed the archive from the Belgian server.

Maybe a hotted serial port to 38400bps would be sufficent? On a 8MHz ST
most of the time is spent on actually processing the recieved data. For
file backup purposes higher transfer speeds are justified, though.

>NAT software will be needed, since STinG does IP masquarade.

If you have a dialup Internet connection and a TT use STinG on the TT to
handle the network with the pc on the local 192.168 side. Makes a good
firewall too. With a ST you only have one serial port. (Yet to see any
tcp/ip modules in windows that can handle MIDI ports!)

With pc on a xDSL connection use the pc as router with NAT etc. With the
shareware NAT32 Windows program and a "faked" dialup connection to the
Atari you get full Internet connection for the Atari as well. This is the
setup I'm running right now. It's been improved yesterday with a

dedicated TT for my webserver and a second TT on a subnet under the other for my personal use. On a second subnet my MSTe is connected to the TT No. 2.

I have not tested to run two dialup connection at the same time in Windows. Windows is _not_ very flexible for network use! It works fine if you use it in the same way as Bill G. does. If not you may find yourself in very deep water.

>http://gallery.uunet.be/saka/atari/reality/rtl8012.htm

I posted a few articles here on the subject right before christmas. Search on Deja News! I am now halfway through a rather long text on how to configure a setup like this. Like I wrote earlier I will put it all up on my local webserver at http://atari.mine.nu/ but for now you will only find a copy of my other homepage there for test purposes. And, some files are missing too.

Unfortunately I tend to spend a lot of time at work so my free time is mostly spent in bed...

I have XMEN_MGR.PRG in the Extras folder of MagiC4
but I cant find any reference or info in the manual about it.

Can anyone tell me what it is for and where to put it.
Or maybe there is a newer version that does the same job??

Indeed what we, Atarians most needs is an up-to-date browser, capable
to use java-script, CSS, etc..
The only reason why I would migrate to another platform is the browser.
I fully agree with Dennis the other Atari Internet clients are good and
some of them outclasses their PC/Mac opponents with ease.

I think they simply programmed a modified VCS console. But most computers were initially designed on mainframes (e.g. the ST was designed using a VAX).

The VCS is programmed in Assembler language.

The problem with the AHDI s/w is that it doesnt like holes in the ID
scan, so with the ZIP you'd be on ID 5 or 6 so the scanning would stop at
the first unavailable ID, i.e. in your case it wouldnt scan beyond ID1.
There is a porg available that stops these holes, but...

>Obviously I need something more up to date, any suggestions?

HD-DRIVER is the only serious choice in Hard drive kick starters, there
is a demo available from the authors web-site.

I've just bought a HP 930C. I went for it mainly because I surmised
that I could at least output in B/W from various Atari programs, and
maybe get colour from Imagecopy etc. TBH, I've more-or-less given up
using the Falcon now for most everyday things, but I did have an hour
with it and the new HP. No colour from Papyrus, just B/W, but got a
reasonable colour print using Imagecopy.

When I have a bit more time I'll play a bit more and see what gives.

As far as the output from the PC is concerned, it's excellent, even at
small point sizes, almost as good as my HP 4 Laserjet at 600 dpi.

Just shows how much the HP inkjet has advanced since the days of the
DJ500!

Best wishes
Mike Kerslake

Hi Mike,

Isn't it sad that so many of the Atari/Falcon etc programs that we rate
so highly are incapable of giving output to the latest printers. How
humiliating it is to have to grub about in the second hand market for a
printer/scanner or some other accessory that will work with our Atari.
Shouldn't this be telling us something.
I have got a CD with a full AVI version of a very recent film on it. Had

hoped to play it with AniPlayer. No way, apparently the AVI is compressed with MP4 something or other. My PC collegue said it played 'straight from the box'. I can't wait to tell him my beloved Milan can't touch it! I don't think!!!!

Bob king.

Hi...

I needed to get some SMPTETRACK music files off off some Atari floppies so I could export them as midi files into my PC. I still have my old 1040ST... but no monitor. I also have a TT set up at my mother's, but I was looking for a way to do it at home. I eventually (with Tim Carmody's good advice) found STEem and using that and Emulators Gem Explorer utility, was able to copy the files from the Atari floppies to my PC, open them in Editrack (now freeware) and export them as midi 1 files into Cakewalk. Worked like a charm, too...

I haven't changed the DTE rate on my port for over a year. Last
time I did was just some testing to see if 115k worked any better then the
230k that I use. It wasn't so back to 230k. You just have to love a good
modem, unless of course you are some sort of pig that lives in an area
that has DSL or cable modems or some other plot like that ;)

Those were the days weren't they. I can remember getting in quite
a few arguments with Derek pain in the as* I work for Microslop Mihotchka
(who by the way will probably reappear since his name was mentioned, he
used to be somewhat like a certain person that hangs out in the advocacy
group). People were spreading false rumours left and right about how they
dated the sister of someone who had drinks with someone who once met a
person that looked exactly like Bob Brodie and he said... Quite alot of
nonsense. It was the catch 22, atari really did have a Falcon 040 in the
works but not enough people were buying the 030, so they gave it the chop.
Not saying that the 040 machine wouldn't have had some problems. I mean
it was just looking to good in the specs not to have a touch of atari
about it somewhere.

>At the moment there are two alternatives for the aging TT and Falcon, I would

>example a Milan?

I can understand the idea behind it. Many CT2 owners are very
happy (not all but many). Many falcon owners are attached to their trusty
old birds, the CT60 just soups it up some. I've actually chatted with
some people that aren't interested in any box that doesn't say atari on
it. Not that they are bigots, just that Atari is their hobby and a
computer starting with M loses the mystic for them.

>How can a Falcon with all his hardware limitations be superior by just banging
>a faster processor in it? by pure magic? poor graphics, slow harddisk access
>by today standards, no easy way to connect ethernet card etc...
>

As I stated above. The probably the most honest answer is that
the reasons are all a litle bit insane. Somewhat along the lines of the
reasons that any of us use our old TOS boxes.

>Instead of bying what is available *now* and supporting the people that have

>they can't generate any money from the previous project, can you imagine what
>a bankmanager his reaction is looking at Hades or Milan?
>

Well here are my reasons for not buying either of the existing
clones.

1. Hades - I just don't have the money to afford one.
- Some of the stats are a bit dated.

- If he could somehow manage to pull off some updates and
cut the cost in half (big if there) I could see people starting to drool
over them a bit more.

2. Milan - COMPLETELY AND ALMOST TOTALLY IMPOSSIBLE TO GET IN
NORTH AMERICA!!!!
- The same rant that I've seen elsewhere, why can't I
just buy a barebones mother board with drivers? I can scavenge enough
parts from our junk room at work to flesh it out very happily.

>If we all keep postsponing the moment to upgrade our ST's, Falcs and TT's the

>faced with the consequences... 90% of the existing software is written to run
>on the ST, there's hardly anything that takes advantage of the superior power
>of the successors.

I don't know if that's the reason entirely. Atari attracted alot
of people that wanted bang for their buck, which in the early years was
exactly what you got with an ST. While later models sold in some numbers
the over all totals of everything after the 1040 STFm probably don't equal
what the STfm sold. (I'm just guessing here on numbers I saw close to a
decade ago, so I might be wrong, but I would guess I wasn't). The lower
supply of TT's and Falcons kept the demand up for them so that they are
still a somewhat valuable commodity. Easily selling for 2-3 times what
their counterparts in the Mac or PC world would sell for these days.

But the limited market also means limitations on software
developed for them. I would love to develop something slick that only ran
properly on some super fast and modern atari clone. But I can't afford to
buy one and I haven't seen any company running to my door to give me one.
I try to ensure that the software I write will work on the clones, as
hopefully one day I will find one for a price I can afford, but in the
mean time I write for my main machine a TT with a Graphics card. With a

litle bit of thought and planning on my end I can produce something thats
not just limited to that but it's impossible for me to write drivers for
PCI or ISA ethernet cards since I only have one slot and it has my
graphics card.

I guess what I am saying is that we are in a catch 22 again.
People won't buy the clones unless there is a reason to shell out the cash
and commercial developers won't develop for them until there is a large
enough installed user base.

>We're all crying out loud for a new browser that can handle at least anything

I love these posts in a way. You'll have to excuse me. Awhile
back I was dealing with a local ISP that I was having problems with. The
on site person didn't know how to answer my question (it had more to it
than how to configure "Dialup Networking.."), so he passed me on to their
on call consultant. He had not a clue of what I was asking him, pretty
sad since he is supposedly a professional and gets paid for his knowledge,
but I guess it had to do with something other than configuring a nntp or
pop server. So then he passed me on to one of the top people he knew in
the TCP/IP field, this guy had enough microsoft degrees to stock a
bathroom the day after a Texas chilli eating contest. He couldn't get
over the fact that I was connecting with a 20 meg 68030 machine to the
net. Just thought this was a virtually impossible thing to do, then I
said well the sofware I run has put people with 512 k 8 mhz 68000's on the
net with nothing more than a modem and a floppy drive. I believe this was
too much for him to believe. This was all taking place in a general email
conversation back and forth over why this IP was dumping TCP packets with
no reporting and any way they could run a log or let me come in and look.
The conversation ended with him not knowing of anyway to do anything on
their side and his wishing me good luck with my dream of getting a 68030
onto the internet. So yes virgina, there are morons in the IT field.

>Ah shit... why do I even bother,
>Am I really the only one here who thinks differently?

Aside from the fact that apple lawyers will probably be suing you
over that sentence being used without paying them royalties. No you are
not. Are market is just basically $#$^!@ at the moment. To make a clone
manufacturer really take off they need to ship some sort of entry level
machine in the $600 US range and have the ability to keep up with demand
and do a monica lewinsky on all the market to keep people happy.

My guess is that the clone manufacturers can't meet this price point. Somewhat along the lines of other messages floating around recently, it would be nice to see Milan selling directly via the web a barebones system. Might even be more cost effective for them to have an option for a completely barebones system. 040's are cheap here (the USA) and fairly easy to get ahold of. Give me a motherboard,the CD of drivers a manual for installation with a list of compatible cards etc that have been certified and I'd be happy.

So far the only Milan I've heard of for sale in the USA was used and going for $1000. That's just a litle expensive for a 68040 machine to me, especially used.

You think you are frustrated there about people not buying them. Think about how the US dealers felt when they had calls from people about would they sell them coming in on a regular basis, and all their calls to Milan fell on deaf ears. If Milan had got off it's posterior it could have doubled the number of machines it sold as there was at least that much demand for them here.

Well I've got actual things to do other than bitch so I think I'll go now as well.

Anybody,
I am relatively new to the ST but not Atari, I bought my 1040 ST for $100 I have been in contact with a guy from Rotterdam, who will remain nameless at this time. I have learned lots from him and am willing to share my knowledge with anybody who needs the help with anything ST. I know how hard it is to find the information and the software to do what you want with this thing. My e-mail address is firest@williams-net.com you can correspond there or just post your message on the newsgroups I check them out 3 times a week or more so I may be able to help.
Thanks,
Carey

A.F.S.T.S

The Algorithmic Film Sound Track System
By Rudolf and Christian Banasik

Released as Freeware January 1rst,2001

Several months ago I was "surfing" the net, when I came across by chance upon Christian Banasik's Web Site.
On his site he has a page descibing his software he created for Atari computers called A.F.S.T.S. I contacted him asking about the availability of this program. I finally recieved an answer, and on January 1rst, 2001, he sent me the program files releasing them as FREEWARE to the Atari-Midi Community. You might call it "2001 an Atarian Space Oddity". Oddity it is as it is a very unique Algorithmic Compostion package. It does not rely on recording midi as in sequencers but on user input of scales and parameters.

It is now available on my site:either on the download page, or the AFSTS page.

I would welcome any comments on this very unique application. It is programs like this that want you to keep an Atari in the Music Studio!

Source record: 52431

Hello,

I recently installed a 2 gig IDE on a Falcon. (TOS 4.04)
At first I partitioned using SPLIT into 4 equal parts.
Everything works fine.
But when I boot Diamond Edge, it will not recognize the drives.
(Invalid boot sector)

Then I repartitioned 200 600 600 600 - CDEF respectively
Diamond Edge recognized C but not D E or F.

Does anyone know the maximum limit that Diamond Edge will accept?

I would like to optimize partitions. But this posses a problem
if I would like to work on say a 1 gigabyte partition.

How would you optizmize?

thank you

ken

>two Falcons with different (rather old) CPU accellerators do not work
>with the Eclipse.

It's rather strange that no-one has come forward in here with a working
setup. The only reference that I found in my archive was from someone who
also couldn't get this combo to work (he reminded us of the need to cut the
track between pin 21 and 22 on the Eclipse card for the installation).

>Now for some shameless plugging: :-) An ethernetdriver for PCI cards
>based on the RealTek 8029 chip is coming. The driver will be free and
>open source but you will of course need an Eclipse... ;-)

I'd buy one tomorrow if I knew for sure that it would work with my CT2B, so
if you're looking for any testers? ;-)

Allegedly, we're expecting to be able to use cable modems on our cable
network RSN, but from what I understand these won't work on Ataris (a
protocol question I think). A pity really, I know that one can use a PC as a
gateway but that rather defeats the purpose!

Hi all,

The Place2be.be news site seems to have vanished, anyone know what's
happened to it? The page which is displayed says that there is a new
Internet presence.

Hi Lonny,

Do you have a translation in English for Boxkite 2.15? I use a
registered 2.13 version and want to upgrade if that is of any
use.

Thanx,

Raoul Teulings

This has not changed.

When the Milan was available and working, the most-heard question was about
an 060 upgrade, and it looked like many people waited until the upgrade was
demonstrated - and then bought the 040 version.

>If we all keep postsponing the moment to upgrade our ST's, Falcs and TT's the

>the alternatives have all filed for chapter 11.

Or simply stopped production. When the number of sold units gets down to a
dripple, you don't make another batch of PCBs - that's what has happened to
some add-on boards already.

>
> Does anyone know the maximum limit that Diamond Edge will accept?

You must use the option to make the sector size as small as possible. I
believe DE has a limit at 512MB since it can't handle a sector size larger
than 8k :(
With a 2GB drive, you'll need 5 partitions to make DE work with them all.

> I would like to optimize partitions. But this posses a problem
> if I would like to work on say a 1 gigabyte partition.
>
> How would you optizmize?

Ataris' old CHKDSK3, which should be available in any PD-archive, does
actually work very well in spite of it's age and it seems to work with any
Atari-compatible partition :) DE is better and has more options, but it's a
pity it won't work with large partitions.
The best would perhaps be to have a defrag function built into HDDriver
somehow, but I believe it would be very much work to make such a function
from scratch and make a new, optimized function that works with every kind
of partition, so I guess we'll have to make use of what's available...

Best regards,
Claes

Hm, that proves there is nothing wrong with my set-up. It must be
Hades specific. Even booted with just a minimun of auto prg and acc the
display of the time stamps in Boxkite are wrong and this not only with
V2.15 but also with 2.13 and 2.07

Maybe you could ask the programmer about it
hbecker@atari-computer.de

He, I just managed to get Boxkite working. If I let Thing (autostart)
start Boxkite it will display the right timestamps.
Also I found that if one use Cops instead of Zcontrol or Xcontrol Boxkite
will work correct even from autofolder.
Can it be that it has something to do with time cookie?

>Shouldn't this be telling us something.

Yes, it's very sad. Until very recently I was content to use my Falcon
for just about everything, but we've moved in October 250 miles from
our old home and keeping in contact with our friends and family has
proved expensive so we've started to use email and attachments
(JPEGS/MPEGS) as I have unlimited 'net access. Initially this was
still possible to a degree by using the Falcon, but then my ISP
changed their log-in procedure and from what I can see only a MiNT
set-up would be able to handle this. Therefore I was forced to use the
quite basic PC I have to make use of this 'free' connection. Of course
I've started to use the PC for just about everything now which is a
shame, but I got tired of most web sites not working with CAB :-(((

However, the printed output from Papyrus/NVDI onto my Laserjet 4 is
still fantastic when I need it for commercial reproduction. I'm about
to start laying out a new magazine and I will use the same set-up I
used for Atari Computing magazine because the control over halftones
is just far superior than anything I have used on the PC. Forgive me
if I am wrong but I have yet to come across any option in Window's
print handling to alter the halftones, so pictures come out dithered
instead of halftoned which is useless for photocopying or offset
printing. Even the DTP program I have which does have some form of
optimising for printed pictures falls way short of what I really
require.

>I have got a CD with a full AVI version of a very recent film on it. Had

>compressed with MP4 something or other. My PC collegue said it played
>'straight from the box'. I can't wait to tell him my beloved Milan can't
>touch it! I don't think!!!!

Yep, know what you mean. This Christmas we had a ton of 'special'
messages come via email and hardly any of them would have been
viewable on the Falcon. Even the PC struggled a bit with some of the
more exotic stuff!

WRT another thread I must reluctantly start to agree with the view
that existing Atari hardware just ain't up to the job given today's
requirements, especially online. However, if you accept the

limitations, or just don't need an Atari to do certain things it still is a great machine.

After putting up with Window's ability to crash for no reason, slow down to a crawl and scatter stuff all over the place, I love to just switch the Falcon on, see it boot up in seconds and then produce top quality printed output in seconds without a glitch.

I must admit I am actually looking forward to laying out this new magazine with Papyrus and using the Falcon seriously again, if only to keep my nerves intact!

Anyone tried to use Star Office on the PC to produce a simple newsletter?

Two hours later I gave up and used Papyrus on the Falcon - exact same job done from scratch in about 5 minutes - as witnessed by wife!

Now that does say a lot, but from an Atari POV!

;-)

Best wishes
Mike Kerslake

I don't have cops or zcontrol installed to do tests with.
That is interesting though. I suppose it could be related
to the time cookie, if Cops is fiddling with it, or the other
ones were.

Look out for HP-optimiser, checks and repairs disk problems and
optimises, also its written to work with FAT partitions so is able to be
used reliably on modern OS's.

You know of course on the bottom of the box that appears in the BoxKite selector, there is a slide button which moves the information on the screen from left to right. I really do not see the time until I use this slide button.

I maybe wrong here, but don't TUS sell such an adaptor? I used to use a greyscale vga on my original STe years ago - it only worked in highres mode, not because it was mono but something to do with the different frequencies that low/med res outputs. So you'll still need a TV/rgb monitor for these two resolutions.

No - I just wanted to see how large the file was, and perhaps take a
peek in it. Thanks for pointing me to the right one.

But I would still like to know what the files with ASCII-7 (, but I
don't suppose this will come out properly after ISO translation) at the
end of their name in the CAB (not CAR as I said :-( ) cache are. Anyone
know? I see them when I use File>Modules>CAB Cache to read my downloads
to see if they are worth moving to my HTM_DOCS directory.

According to the acknowledged expert, Dr. Uwe Seimet, you should never
format a hard disk (unless some sectors have been damaged) -
partitioning is enough. Most people agree that his HDDRIVER is *the*
hard disk driver for the Atari and clones platform. V8 has just been
released in Germany and is bilingual English/German. However the English
manual will be available only from Atari Workshop in the UK (RSN!).

Hi Ken,

I have a 1.08-gig Toshiba 2.5" IDE in my Falcon, using TOS 4.04,
Nemesis, ICD PRO 6.5.5.

I just checked my partion sizes using Diamond Edge, and I have:

60 - 60 - 60 - 60 - 10 - 833 megs
C D E F G H

I used ICD utilities to do the partitioning. Maybe that makes a
difference?? Did you use DE for that? Did you check the
manual/docs for DE concerning this?

Hope that helps,

Clayton Murray

Yes. An adaptor is available from ASP in the U.K. It is a small
plug,Atari monitor on one end, VGA on the other. Works very well (tried
it on 2 monitors). Cost is 15 U.K. pounds.

Hi again Ken,

I forgot to add.... optimizing partitions works fine for me using Diamond Edge Version 2.04 Release Date: September 28, 1995. I am able to optimize an 833-meg partition. Not sure if I've tried anything bigger. I have a Syjet 1.5 cartridge divided into 2 750-meg partitions, but there's a cartridge jammed in it right now, so I can't check it out. If I get ambitious, I'll try and do that today... ;-)

Hello,
Here are the details of the interview in STC with F.Aschwanden of
Medusa Systems.

Indeed, 200 definite preorders required & support from
programmers.
Project name : Pegasus
Speed : 3x Hades 060
AGP 2.0
PCI 2.0
USB 2.0

First TOS 3.06 later Magic and Linux
Standard Atari Midi Ports
RAGE-PRO-PCI (driver already available, other cards possible)
No sound card. Possible though with existing sound
cards/Adaptors
Price approx between DM 1500 and DM 2000 incl. keyboard, mouse,
grafics and RAM
Completely programmable
Can be finished in April 2001

Looks wonderfull to me ! One for me please !
Cheers Dan

It enhances MagiC with MultiTOS/TOS 4.x compatible popups and cascading
menus. You should put it in your START-folder or let the desktop autostart
it.

Hi all,

I noticed in the latest catalog of Tiger Direct the sale of new UMAX Astra 1220S and 1200S flatbed scanners. These are not the latest and greatest, but they are known to work perfectly with Atari computers via the ScanX software. At around $50 US, I just picked up a backup one for myself. (No, I don't have any association with Tiger Direct -- but I do recall a scanner thread a couple of months back, so whoever was asking, here's your chance.)

The all in one product is called "Newsie" and it is available at pretty much any Atari ftp site. (May I suggest 193.190.204.128, or chapelie.rma.ac.be if you prefer). You will require a copy of STing (sting.atari.org) to handle the TCP/IP stack. If you have a color AES (like NAES), Erik Hall's Mymail is my favorite emailer (http://www2.tripnet.se/~erikhall/programs/mymail.html).

Let us know how you fare.

You probably already know that NVDI goes up to the HP890 - you've
tried that? (I say that without knowing what the 950 does extra).

Is it worth enquiring whether ASH have developed drivers for the more
recent HP's? I know they haven't been responding to much mail
recently, but it's worth a shout...

XMEN_MGR extends the system to support the sub-menus used by StartMeUp
and various HiSoft utilities.

Add it to the location specified by #_APP in Magx.inf - that is,
Magic's autostart folder, which is usually C:\AUTO\APPS or
C:\GEMSYS\MAGIC\START

It installs the functions menu_popup() menu_attach() menu_istart() and
menu_settings().

appl_getinfo() returns a "1" for the corresponding sub-functions when
XMEN_MGR is installed.

Bob,

Something strange is going on. The 950 is simply a PCL3 enhanced printer, so it should accept PCL3 commands. According to HPs US website, the 600 and 540 drivers will work for DOS applications, so I would be very surprised if it can not be made to work.

Consult http://www.hp.com/cgi-bin/cposupport/get_doc.pl?SNI=hpdeskjet919039&LC=printers&Tfile=bpd06939 .

Hey you are forgetting STiK2, which if he had a STiK setup before,
he can just drop the new program in the auto folder and remove the old
.ACC and should have a working setup. Not necessarily fine tuned, but
should be drop in place replacement if the old setupworked still.

The primary problem we in the States face is the inability to buy the computer. I often click on items to buy, type in a credit card number and watch the merchandise arrive in a few days. Should something be defective, an email generally solves the problem.

Ignoring the fact that the Hades is quite expensive (3150SFr, or just under $2000US) it is difficult to even learn about the European computers. If I say, wanted to run 1280x960x24bit at 70+ Hz, could the provided video card do it? Does switching to 640x480x256 require a reboot, or can it be done on the fly? Heck, I just today read that the TOS can be configured for English! (Can an American keyboard be used?).

Once that hurdle is cleared (or the decision is made to charge in blindly), how do you order? I (unfortunately) am only capable of ordering a computer in English (my Spanish and Estonian are both pretty much limited to asking where's the bathroom and how your mother's doing). If I want a Milan with 060, SCSI, and TV cards with 10GB HD and 64MB RAM, who do I call or email? System Solutions does provide a convenient way to order a Hades, but counting shipping the cost is over $2400, which is more than I can afford for a home computer.

Once the order is accomplished, you have to hope you get product. Suing a person overseas is practically impossible for the typical person, so when you send your money you basically hope something, someday, will show up. (By the way, this is my main reason for wanting the CT-60 -- I can afford to lose $300 if something goes wrong, but $1000 is 2 or 3 years of Atari equipment in my house, and losing that much would effectively kill my interest in the hobby).

If I lived anywhere near Germany and could drive over to see the items and the people selling them, I'd probably have a Milan now. Having never seen a Hades or a Milan in person, I'm unwilling to order something that expensive blindly and hope something shows up. Sorry, but I find $1000US to be too large a chunk of discretionary income to risk.

I firmly believe that anyone wishing to sell to the States needs, at the minimum, to accept credit cards (or have an American distributor), to respond (in English) promptly to email, and to update their English web pages two or three times a year. Anyone wishing to sell any quantity of computers needs to get their entry level product down to around $1000US. At this time, I know of no company that meets these requirements and thus I look for alternatives.

Hi Clayton,

I wouldn't want to risk partitioning with Diamond Edge.
I think it is "safer" to partition with HDdriver.

Oh BTW, thanks for the info on using laptops in a Falcon.
I happened to come across one that had the correct mounting holes.

Yep, I know! Although I have to admit that Windows2K is the first Windows-
incarnation that really works for me: it has beaten OS/2 from my system for
the first time since 1993!!

>I posted a few articles here on the subject right before christmas.

Dennis,

I am not thinking of writing a super duper all-but-the-kitchensink browser,
don't worry ;-) (although I HAVE written some-kind-a-browser in 1995)...

No, one can use the Internet for more than 1 protocol...:-) I like to use
the Internet to connect 2 machines (or more) and do interesting stuff like
parallel or distributed computing, etc. I have plans.....but not in the
short term....:-)

When the US CAB 2.5 to 2.7 upgrades originally came out, I held off because 2.8 had just been announced, and I figured that 2.8 upgrades would be coming out shortly. Obviously, that was a poor decision, and I find myself wondering how the English speaking 2.8 users obtained their copy. So, how did you?

What exactly was improved in 2.8 over 2.7 again? I'm afraid I've forgotten.

Galen (who just sent an email to Chromagic about ordering the 2.7 upgrade)

> Cheers Dan

Only one big problem .. what CPU is Fredi gonna use in this machine? An "old" ColdFire solution is gonna make me NOT buy such a machine, because it lacks both FPU and PMMU. And without at least a PMMU, it is not, in my opinion, an option as a processor in a desktop system. This is because I'm using a MiNT-setup and have discovered the usefulness of Memory Protection, and I'm not going to stop using MiNT!

But, there is a "new" ColdFire core in the works, which supposedly will contain both a FPU and a PMMU. A machine with such a CPU I would buy anyday! But this "new" CF core is not yet available (or is it?).

Anyone know more about this?

>
> Anyone know more about this?

The "new" Coldfire core, the 4e version, is not available yet as silicon although I think you can license it if you are planning to make an ASIC. The MMU and FPU is only coprocessors added to the core and the core is not significantly altered. Furthermore, the MMU and FPU are not compatible with any MMU or FPU used in any current 680x0 processor so you you would need emulation layers here as well. The ASIC core is only feasible if you are aiming at 100 000 chips or more.

Motorola says that the first silicon part of the core will be a dual processor design with two identical processors. I don't know the maximal clock frequency of this part but I would think that it would only be a technology scaling from the current core.

I have no idea as to which CPU is going to be used in the Pegasus but as I wrote some time ago a Coldfire CPU is _NOT_ compatible with 680x0 code and you cannot easily make it compatible. It is true that Motorola supplies an emulation layer but that layer do not emulate all instructions.

Motorola have never claimed that the Coldfire is 100% compatible with a 68000. They do say that you can execute 68000 code but that really means that you can only execute _some_ 68000 code on the Coldfire. That is a very large difference. They do point out that patching is needed.

As this is not c.s.a.st.tech I won't go into details in the body of this message but I suggest that the interested should read the section below. In short, the emulation layer that Motorola provides can never emulate all 68000 instructions. And you can forget about the multiply and divide instructions that were added to the 68020. They do not behave the same in the Coldfire as in the 68020 and you cannot emulate them unless you patch the software. Also, the Coldfire gets slowed down by at least a

factor 4 when emulating, i.e., the Coldfire executes code 4 times slower. These are MicroAPLs own figures but I would expect the performance to be even worse as a lot of very common instructions are not supported by the Coldfire, more about that below.

The bottom line, don't believe the performance values until to see and experience the performance of real live Atari applications. Don't be surprised if the Pegasus(?) is not faster than a stock Milan.

All this is of course based on the assumption that the MicroAPL CF68KLib is used. You can get better performance with an emulation engine similar to the one I have for the Tempest but it is not trivial to do code such an engine or even adapt the Tempest engine to Coldfire. And as I point out below such and emulation will never get as efficient as on the PowerPC.

On another level, who are the developers that are going to support this machine? I have sent a mail to Ulrich some time ago saying that I might be interested to help out but that I do think that a Coldfire is a very bad idea and that other designs should be considered. I suggested PowerPCs as there are some very good PowerPCs just around the corner. To be honest, I said I was going to send him a lengthy mail with motivations as to why I think Coldfire is a bad idea but I haven't done that yet since I've been very busy lately. I got very little information from Ulrich, however, and I would very much like to know if anyone knows more. What developers are going to support it? I'm eager to find out!

Best Regards
Sven Karlsson

<------ WARNING Technical details below --------------->

The interested should read:

The ColdFire Programmers Reference Manual available from http://www.motorola.com/SPS/HPESD/prod/docframe/docs_frame.html ("All Coldfire" link)

You can read about the V4 core at http://e-www.motorola.com/collateral/V4PRES.html and most documentation regarding the various cores are available from http://www.motorola.com/SPS/HPESD/prod/docframe/docs_frame.html ("Coldfire Cores" link)

The emulation layer is documented in http://www.microapl.co.uk/Porting/ColdFire/main_index.html

A word of caution, some of these documents, most of them marketing documents, easily leads you to belive that the Coldfire can be made 100% compatible with 68000 code. However I would like to point you to http://www.microapl.co.uk/Porting/ColdFire/FAQCF68KLib.html. See question "Will my code require any modifications to run under CF68KLib?" and question "What is the performance like?". The answers to these

questions clearly state that you cannot emulate all instructions correctly and that you will take a severe performance hit.

Why is this so? Some very common instructions are not supported by Coldfire and needs to be emulated:

add.w, add.b, sub.w, sub.b and variations such as addq and addi are not supported. In fact no ordinary arithmetic instructions operating on byte or word is available. DBcc, i.e., dbra and so on, is not supported. Link/unlink is also not implemented in the core. All these instrctions must be emulated.

To further complicate things there are a few adressing modes that are not supported. For instance, the "register indirect with index" mode can only cope with a longword index size. If you try to use a word size you will get an adress error. In some occasions you won't even be able to emulate the instructions. You can, for instance,never emulate this kind of instruction: move.l (sp)+,x(an,dm.w), the the CF68KLib for more information.

Let us lay the compability questions aside and look at performance.

Consider the following code snippet commonly emitted for C switch statements:

```
cmp.w #limit,d0
bhi.w default * other conditions are possible as well.
add.w d0,d0
move.w jump_tab(pc,d0.w),d0
jmp jump_tab(pc,d0.w)
```

On a 68000 this is one of the fastest ways of doing a switch statement. The first two instrctions are handled by the Coldfire but the other three will cause one illegal instruction or adress error each. See below:

```
cmp.w #limit,d0 * OK
bhi.w default * OK
add.w d0,d0 * Illegal instruction
move.w jump_tab(pc,d0.w),d0 * Adress error
jmp.w jump_tab(pc,d0.w) * Adress error
```

The CF68KLib handles a illegal instruction in roughly 90 processor instrctions and an adress error in roughly 100 instructions. So instead of taking roughly 14 cycles on the 040 this small snippet would take 262 instructions on a V4 Coldfire. Motorola suggests that the V4 achives approximately 257 MIPS at 162 MHz, i.e, you can run 1.6 instructions per clock cycle which means that the snippet takes approximately 160 cycles. The Coldfire must thus be clocked 11 times higher than the 040 to be faster. I might add that the 1.6 instructions per clock figure sounds a bit too high.

Let us assume a 25 MHz 040 as on the Milan and a 180MHz V4 core as the Pegasus is rumoured to have. What is the fraction of instructions that needs to be emulated in order to get the same performance on the Pegasus?

First look at the Coldfire. Let us assume that each exception takes 95 instruction to handle, i.e., there is an equal mix of illegal instructions and adress errors. Furthermore we assume that each instruction takes 1/1.6 cycles. We call the fraction of instructions that are emulated is x. Each 680x0 instructions would need on the avarage (1-x)+x*95 Coldfire instrctions to be emulated. This is ((1-x)+x*95)/1.6 cycles. The net 680x0 instruction rate would be 180/(((1-x)+x*95)/1.6) MIPS

We assume that the 040 executes instructions at a rate of 27.5 MIPS according to Motorola that claims that a 40MHz 040 achives 44 MIPS. Again this sounds too high but as this value is probably measured in the same way as on the Coldfire I'll use this as otherwise we would need to alter the Coldfire value.

This yields the following equation:
27.5=180/(((1-x)+x*95)/1.6) (if we assume equal performance) which yields an x of roughly 10%.

So if more than every tenth instruction needs to be emulated then the proposed 180MHz Coldfire will actually perform worse than a 25MHz 040! And I should add that the Coldfire do not have a FPU yet which will severely limit the performance of applications that needs an FPU. I might add that the currently proposed Coldfire FPU is not directly compatible with a 680x0 FPU and would need an emulation layer.

One out of ten instructions is not much given that the Coldfire do not implement arithmetic instructions using byte or word size. My experience is that word size instructions are quite common.

PowerPCs are much more suitable as bases for new Atari computers. In fact, the instruction set of the Coldfire is very similar to the PowerPC but the PowerPCs have more registers which makes it much easier to make a fast emulation. In my current emulation engine I need approximately 2 PowerPC instructions to emulate a 680x0 instruction. Of I were to port my emulation engine to Coldfire then I would need 3, 4, or more Coldfire instructions to emulate each 68000 instruction as the Coldfire actually have fewer registers than the 68000. The net effect would of course be that you would need a Coldfire that is more than 50% faster than the PowerPC to gain equal performance.

Thus I don't think the Coldfire route is worth it. As always, you are welcome to prove me wrong or point out mistakes. I do make them sometimes you know.

Hi Galen,

thanks for the info. I'll look into it. Trouble is, even if I can
persuade NVDI 5 to drive the printer, my favourite DTP is DA's LayoutTC
which uses its own drivers, as old as the Arc!!! Same for many other
good but aging programs.

Bob.

ASH supply the German version of 2.8. You use the english resource file from 2.7 as there were no changes to the interface

> >What exactly was improved in 2.8 over 2.7 again? I'm afraid I've
> >forgotten.

Mostly bugfixes, but here are the new things from 2.7c (which was the last English Version)(not much!LOL)
- The module for loading JPEGs has been replaced with JPEG_PNG.OVL which will load PNG-graphics in CAB.
- The c't CD ROM from Heise-Verlags (only of interest to German users) had a change in the format of theindex file, so CAB has been modified to work with newer CDs .

That's it! ;-)

Yes ofcourse I do know that. I don't need to scroll at all as Boxkite
fills almost 1/3 of my 17" screen when called. That's why I saw directly
there was someting wrong.

Boxkite is behaving very weird and I think it has something to do with
dataform.cpx. See my parallel posting.

I spoke too quick yesterday. This afternoon when I switched on the Hades
everything was normal. Boxkite was displaying things nice but as Boxkite
start from Thing is not really a good solution, with MP enabled for
instance it took down taskbar and finaly the AES, I fiddled around with
the starting order and newer cpx's. At first everything was normal until
I used the dateform.cpx coming from the 2.15 package with my MP setup.
With this setup the timestamps were gone again. It took me some hours
before I finaly managed the get Boxkite working again.
I found that the dateform.cpx was set to display the timestamps as
month/day/year. After I have set it back to the display I'm used to use,
day/mont/year Boxkite suddenly displayed the date correct.
Indeed, on the TT030 the dateform I'm using is also day/month/year.
So lets hope this was the culprit afterall. I don't like Boxkite as much
as Freedom but at least it works with MP enabled.

There is also fixes for MiNT users. Cab 2.80 works very good now with
freeMiNT 1.15., at least on my Hades.
The new jpeg module can handle progressive jpg much better. Such jpg are
loaded much faster but it seems this is only the case with MiNT-users.
Some Magic users has reported that they didn't notice a speed different
between 2.70 and 2.80.

Some figures done on a Hades running freeMiNT 1.15.10b/N_AES 2.0.0, 256
colormode
Test: reading offline a test page containing 13 midsized prog. jpg's
(35-65 kb) and two small gif's.

1) Cab 2.70e: load time: 1'46"31
2) Cab 2.80: 0'49"75
3) Wensuite 3.30c: 0'17"82
4) Adamas 1.72 pl3: 1'24"86

Note on Adamas. None of the 13 jpg's were displayed correct. In fact one
could barely see what the picture was.

As you see there is a big different between 2.70 and 2.80 but be aware
that this applies to progressive jpg's. If the page contains only normal
jpg's and/or gif's one will not notice a speed difference. And as said
already it seems that Magic users doesn't see any difference. Why I don't
know. Maybe a bug inside MagiC?

>(touch wood by the mile!).

I'm using 0.97g, wonder if i should attempt to re-install the keys.

<......>

Nope, dont work.
0.95 is still perfect though. I'l go back to this i think.

Useful it is but currently there is a small problem with it. It seems
the program is expired and so whenever one start it one get a message
saying that the version one use is too old and need to be replaced.

The latest version I've 0.97b can handle long file names with ease. Even
names like this 'a picture of me.jpg' is supported.

You'l have to pay the same price as the rest of us or go without, like
the rest of us. You should try being a working single parent, you'l know
what skint is then!!.

How do you afford your fees if your poor.

Besides, being a student you'l have access to a stonking great network,
try typing "Atari" into a search engine and get ready to spend hours
trawling.

Another useful thing is that I can convert ASCII-txt to ps. It's also
very useful to strip out html tags from webpages. Furthermore it
convert Un*x man pages to ASCII., etc...
It's the most versatile tool for our platform I know.

I nkow this has been said before, but what about Opera? It supports
all the latest protocols and there are already versions for various
platforms. Maybe if Milan or Medusa could get a deal going some
hardcore programming could convert it. I suppose that's a stupid
suggestion.

>
>Does anyone know the maximum limit that Diamond Edge will accept?

I don't think it takes anything over 64 MB IIRC. The 'Totals' stats overflow and also muck up the reporting of ussed sectors etc, so it's definitely not safe to optimise with it.

>I would like to optimize partitions. But this posses a problem
>if I would like to work on say a 1 gigabyte partition.
>
>How would you optizmize?

Two ways: Use HP Optimizer which works with LFNs (DE doesn't!) and though I don't know its ,imits, I think it will take up to a GB (or perhaps use ZORG - haven't tried that with large partitions).

The other, if you have enough spare space on your disk, is to simply copy one partition to a folder on another, zero the 1st partition and then copy everything back. With a fast copier like Kobold it's very quick (though note that LFNs are only possible with Kobold 3.5 and up, and slow copying down very considerably). Then do the same for the next partition.

This has the advantage over plain optimizing that you won't lose files even if the computer loses power or locks up for some reason - just reboot anad restart the copying. With optimizing, hunks of data are held in memory and will be lost if there is a problems with the machine or power supply.

I usually do a check with rthe Treecheck option in Egale to make sure that the copied folder is identical to the original partition, and do it once more after copying back. There is a similar Tree_chk.prg with Kobold, but that only reports missing files one way round - in other words if not all the files in the source path have been copied, Kobold won't warn you of that (or is it the other way round and it won't report if there are more files in the destination than source? - can't recall).

Correct me if I am wrong, but IIRC that was only supported starting with TOS
4.0, ie. the Hades' TOS 3.06 should be single-language, so you would need a
hades-patched US TOS 3.06.

TOS 4.* definitely supports US keyboards.

I do not think there is one, but here is what you can do. Install PC Speed
or SoftPC on your Falcon. SoftPC you can get on the WWW. It is a nice 286
emulator for the Falcon/TT. Then just run the program that converts the
Pacifist file to a MSA file. Then, on your Falcon in the Atari mode, run
one of the available program to convert the MSA file to ST disks. I have
done this on my Hades and it works great.

The point I want to make is that stock PCL3 codes should work
(obviously they don't, but they should). Do you have an older HP
printer to play with?

Galen

P.S.: I get a wonderful 600 dpi black on my 610CL by telling my older
programs that they are talking to a HP Laserjet. You might try that.

Does it show the correct sizes in the summary dialog? My v 2.12 dated 14 April 1997 didn't (not sure if date isn't when the archive was made or extracted); I also have one labelled V3.00, but this has the same dates and lengths for all the files, so may be bogus.

This is also my concern. Pity the website, or articles do not
give clear indication about the exact CPU arrangement. It happens
to effect how one might react, or at least it does me.

I expected to get a german TOS in my hades, however it seems to
be a UK version of 3.06. Must say I was happy about that.
The keyboard I bought here in the US, needed only about 5
keys remapped.

Hi Ed and Freek,

The program you need is JAY MSA from Jay Software:

The link is
http://jaysoft.atari.org

This will read MSA and ST files, and let you work with them as normal archives:
i.e. extract only one file if that's all you want to do! Brilliant prog. (Mind
you die hard falcon user here so never had to use it! LOL!)

And BTW: what's the link for Soft PC for the falcon?! =)

Cheers,

Hi Galen,

I have a HP510 which is now failing to pick up the paper unless I can flick the sheet at exactly the correct moment. I think the rollers need roughening, but the contraption to do that has gone astray. I have tried every driver for a HP whatsit in DALayout's armoury but to no avail and yes I have tried the Laserjet drivers, no go. I am learning Calamus SL instead, though at my age, that's not dandruff its braincells!! that's a bit hard going. I am being helped by an expert camel keeper.

Bob.

Hi there,

I'm sure there are other options, but one option is to use the shareware word processor MARCEL. (I don't have a link, but I have a copy of the archive which I can email you if you wish)

It can import First Word Plus documents
Then you can save/export as RTF which will easily import into MS-Word.

Cheers,

Hi!

Just wanted to say that Nature have released a new version of the window replacement for Magic 6.x, NatFrame. The new version is v1.0b, and is available at our site nature.atari.org. There you will also find a designer program, so you can compose your own themes, which has been requested by many. Finally there's also a new theme for you to enjoy.

Note that NatFrame also works on MagicPC, and should work on MagicMac, though it hasn't been verified.

Regards
Henrik (Hencox) and Torbjï¿½rn (InSTream) /Nature

Not the check symbol. In fact I should have said ASCII-6! It appears as
a (doubt it will pass through the mail system properly, so it's a
large open square with a smaller one top left overlaying it) with the
Monaco Mono font. With the Atari system font it's a black rectangle with
a diagonal line across the bottom right corner.

I find it in the CAB cache listing sometimes. Clicked on it displays as
a normal html file.

You are right! But it loads and works nevertheless - both the original German and the (mostly) English one that I am working on with a Hex editor. More serious is the fact that the 0.97beta will not accept the same registration details as my registered 0.95. The nag message appears when I run it from a TMP folder. But when I move it to the same folder as my 0.95, the nag messages disappear (though the about dialog still shows unregistrierte Version - haven't got round to translating that bit yet:-(

Incidentally I found that I had to leave at least one of the strings (I *think* it was ZEIGSMIR but am not sure) in one place in German, as otherwise at least one of the modules wouldn't work properly; haven't tried them all yet...

Hello!

I notice in some specs for the TT, MegaSTE and Falcon that they have a
'LocalTalk compatible' serial network port. Was there ever software support
for that port that would enable one to link these machines together? Was there
even AppleTalk compatible software that would let you have a mixed network of
Apple and Atari computers?

Regards,
- Andy.

I imagine a TT with the 19" monochrome monitor and a laser print would make a really nice DTP station. What relevent software is available for the Atari? Obviously I'm interested in DTP packages, but I'm also wondering if things like Texinfo, TeX, troff etc were ported to Atari (I imagine some of them might run under MiNT).

MK> Forgive me if I am wrong but I have yet to come across
> any option in Window's print handling to alter the

> printing.

MS-Windows seems generally ill-suited to publishing, of course that's just my opinion. I was asked to take over production of a weekly newsletter but declined because they insist on using MS-Publisher - probably the worst attempt at a DTP program I've ever had the misfortune of doing battle with =o(

MK> WRT another thread I must reluctantly start to agree

Agreed. People's expectations are always a moving target, but the machines are capable of doing many of the same jobs today that they have done for years. My way of looking at it is this - If the machine is adequate for the job, don't knock it!

Regards,
- Andy.

Unfortunately Interactive is no longer maintained, they shut down about a year ago IIRC. ResourceMaster has since became commercial software, sold by ASH. Fastest way to get to know about 2.11 is to mail the author himself I guess.

If you are after the icon editing capabilities, you might want to check out Interface, another resource editor. The user interface of the latter is perhaps not as user friendly as ResourceMasters, but it is known to be a really solid running application. This program just recently was changed from commercial application to freeware. Download it at this site: http://www.hadley.de/hauptseite.htm

The icon editor in Interface is definately worth a closer look before you run and buy RSM.

Hope this helps,

Joakim

My reason for sticking with a Falcon accelerator is that the Milan or
Hades are TT clones rather than Falcon clones. Maybe with a Desse card
it would help, but there's nothing like having a real Falcon for that
software that doesn't like clones.

> know freakin' nothing about...

Do not be so agitated, the spec's are partially there but in german,
understandable since Atari & TOS compatiables where much more popular
in that part of the world than in the english speaking part, Medusa is
also a Swiss company, hailing from the German speking part of it nb.

The specs are loosly :
ATX motherboard with an 180MHz MCF5407 Motorola coldfire chip
delivering about 290 MiPS (versus 0,8 MiPS with the original ST,
making this unit no less than 363 times faster than an ST)

1 Mb (or 2?) Flash EEPROM for TOS & emulation code (User upgradable via software). PCI Bus, PS/2 or USB keyboard & mouse interface, SuperIo controller (floppy, LPT, 2 x serial), EIDE interface.

From what I understand only the Processor, superIo chip and Speed have been fixed, as it's under development, and one of the objectives of the survey is to find out what specs pepole want to see. Firewire (1394) chips are are for instace easily interfaced to the core and probably would simplyfy the desing a lot but if the puters want IDE that is what they will get. etc

For my part I will buy one if I can buy it as MB only (tried that with the Milan but they would not sell it to me) this means I can use discarded hardware with it, a 10 gigabyte disk is too small form my OS/2 puter, but my entire collectrion of TOS progs & data is less than a gig, etc.

This changed with the MCF5407 part, it delivers around 270 MipS at 163
MHz

Coldife is intended for embedded applications, but so was the 8008 and
the 6502, there was no Microcoputer market when they where designed,
the coldifire part is not as flexible as the MC68060 in terms of
interfacing possibities, but who uses these nowaday's ?

Advanced Grapic Port, a variant of the PCI bus used in all current PC
& Mac computers for interfacing with the graphics gards, in practice
it's 1,5 to 3 times faster than PCI, only usable for grapic cards.

OK! Got it to work but had trouble when selecting "File Parameters".
It turned my colors inside out and had to re-load the colors in the CPX
(not so easy when everything's blocked out!). Looks like a great program
though.

The instruction set of the PowerPC is actually rather complex so the
MIPS figures are certainly comparable.

Best regards
Sven

Hi AGAIN Ken,

(I liked seeing my name up there so much, I decided to post
another one..)

Another thing I can add... I have a 2.1gig Seagate external SCSI
(ST32151N) hooked up to my Falcon. It's partitioned into 2 equal
parts, and Diamond Edge handles that fine. This is the HD I use
for audio recording, and I optimize it frequently (with DE)
during projects.

Diamond Edge vs. 2.04.... I _THINK_ I got it from Systems For
Tomorrow, but I _MAY_ have gotten it from that guy who bought out
the remainder of Toad Computers... Keith _____? I'd try SFT
first, and if I can remember the other guy, I'll get to make
ANOTHER post! ;-)

I've tried loads, but even though some have nice features, and most
are better at image handling than Papyrus, they're either slow, buggy
or unable to do the tricks and tweaks Papyrus does (and I'm even
comparing them with v4 of Papyrus!).

And as for file compatibility - when you say 'save as word doc' you
sort of expect the document to appear in Word vaguely similar to what
you originally did, but that doesn't happen very often!

;-)

This really is a hardware problem I think, I would go for an IDE interface, try;

www.keychange.co.uk

http://gem.win.co.nz/mario/hardware/

Or if you have the extra harddisk, etc then I would get another STE, I got a 1Mb English one for £30 inc P&P and I know people have picked them up for less (much less).

It was an ideal combo. I've used a Falcon and 15" SVGA monitor and
Laserjet 4 for the last few years and it's been top notch.

>Obviously I'm interested in DTP packages, but I'm also wondering if things like
>Texinfo, TeX, troff etc were ported to Atari (I imagine some of them might run
>under MiNT).

I've always used Papyrus, it's not really a DTP package, although it's
not far off. TBH, apart from Timeworks and Calamus 1.09 back in my ST
days I've never really used anything else. They were good for the
time, but would struggle now. I actually purchased for 3 pounds a full
copy of Pressworks for the PC this week so that I could load my old
Timeworks DTP documents into it. It was the only way of having access
to old Atari docs in TW DTP format as I never got TW to run on my
Falcon. Sadly there's no option of saving the DTP docs out in any
other format, but at least I can make hard copy or extract text
without a problem!

Don't know about later versions of Calamus, although there are
probably many here that will tell you more.

TeX was available for the ST, I almost installed it, but never had the
time to learn it, so didn't bother in the end.

>MS-Windows seems generally ill-suited to publishing, of course that's just my
>opinion. I was asked to take over production of a weekly newsletter but
>declined because they insist on using MS-Publisher - probably the worst attempt
>at a DTP program I've ever had the misfortune of doing battle with =o(

I have to agree. I had to use MS Publisher some years ago and was
horrified - never again!

>Agreed. People's expectations are always a moving target, but the machines are
>capable of doing many of the same jobs today that they have done for years. My
>way of looking at it is this - If the machine is adequate for the job, don't
>knock it!

People still use manual typewriters and are quite happy. It's when we
all fall for the marketing hype/con trick that causes the problems!

Have fun!

Best wishes
Mike Kerslake

I'm told that setting some Environment variables is mandatory for later
versions of AtarIRC, would that be the cause of the crash? Seems a tad
violent if so?

I have very little hope that changing the HD software will help, as
it's a hardware problem but here are the names.

CBHD, I think this has been converted into English (was German)

AHDI, Ataris own HD drivers

257. IDE HD Questions

Message-ID: <yPi56.4313$s4.3039@news.indigo.ie>
Source record: 52382

Hello all,

The same source as was offering the SH CD-RW has dumped a Maxtor PC IDE Hard disk on me. I am just wondering if this can work with the Falcon?

I had a quick look inside my C-LAB Falcon MK.X and while there is plenty of space for the hard disk, ther is a rather striking difference between the sizes of the disks. (The one in the falcon is very small in comparison)

This new drive came from a desktop PC so has a slightly larger IDE connector plus it needs a power supply cable.

Does anyone know if such a drive can work with the falcon, or if it's better to consign it to the rubbish tip?

Cheers,

Jerry

Hi Jerry,

> Does anyone know if such a drive can work with the falcon, or if it's better to
> consign it to the rubbish tip?

It will certainly work as long as you get the proper cable. You need an
IDE 2.5" to 3.5" cable. You can find these cables although your local PC
dealer won't probably have them. Most Atari and Amiga dealers have them.

You will also, of course, need power to the drive.

Regards
Sven

Hi,

>Don't know about later versions of Calamus,
>although there are probably many here that will
>tell you more.
According to all the possibilities that are in
Calamus I would recommend it but only depending
on what you do with it. For 'plain' DTP Papyrus
is o.k. I am also having several TT's with these
19" monitors and it works fine but on the other
hand is color one of the best persuaders if you
use it modest and to its right so a good
colourmonitor and graphic card is a sort of must
too. According to Calamus: I know people who
also work with Quark Xpress but still use
Calamus for a lot of things.

cu,

Raoul Teulings
3 x TT, 2 x 1040 ST, 1 x Stacy, 1 x STBook, 2 x Portfolio, 1 x Jaguar, 1 x Lynx.

A grain is usually too little. ;-)

>especially when these are supplied by the manufacturer...

Yes, but I didn't find any others at the time.

If you want some numbers from real programs, just look for SPECmark
results. In one place I found numbers for a 603e/200 of 6.4 for integer
and 4.1 for float (that's average numbers over a large number of programs).
You can find the corresponding numbers for a bunch of other chips below.
Those numbers are all from a single site, and the 603e/200 number there
was significantly different (even then it was about twice as fast as the
'060 on the integer tests), but compare it to the 603e/300 one (that is
obviously a newer chip and the tests were likely run with a newer version
of the compiler, or simply a better one).

Like all benchmarks, the numbers depend on the system, of course, as well
as the compiler that was used.
On todays chips, the compiler can make a huge difference.

Processor/speed SpecInt95 SpecFloat95
68000/16 0.14 0.16
68030/33 0.42 0.49
68040/40 1.16 1.31
68060/66 2.18 2.33
601/110 2.66 3.59
603e/200 4.40 2.80
603e/300 7.65 6.10
604e/300 13.20 9.40
G3/400 17.60 12.20

G4/500 23.78 22.67
Power3/500 27.80 70.10
21264/666 44.00 66.00

PII/450 17.40 13.00
PIII/600 24.00 15.90
PIIIe/600 28.29 24.86
PIIIe/1000 47.70 41.41

>Motorola seems to hold benchmark tests that differ each time... in 1997 the
>603ev/200Mhz was rated a 195 MIPS, so over the years it seems to magically
>become some 40% faster, the 68060/60Mhz was rated at 130 MIPS three years ago

Possibly another definition of MIPS was used (the numbers I stated for
the 603e was Dhrystone 2.1), and the compilers were certainly different.

>To put it bluntly: in my book all this benchmark number crunching is strictly
>for the fanatics.... I like "the everyday use" benchmarks a lot better, i.e
>how long will it take Photoline to rotate a 10MB TIFF, how long does is take
...

But when we don't have a machine to try those things on, there is little
choice but to go on the numbers one can find on the net. Those are
generally 'standard' benchmarks of various kinds.

>>Obviously, the first time a program is run no translation has been done,
>>so the processor must spend time on that. Next time it won't have to.
>Sorry, but my simple mind can't grasp this, would you care to explain this
>with some more details? I'm sure others here are puzzled as well ....
>If the processor can "remember" it must store this information somewhere, only
>place I can think of is the harddisk... I'm probably wrong because retrieving
>information from such slow media would only cost time...

It was mentioned earlier by someone else that the translated version was
written to hard disk. Certainly, this must be read back again next time,
but that would be done when loading the program. Once it's in memory there
will be no extra delay, of course.

>>The neat thing with an 'Atari' with a PPC is that you'd still have the
>>same OS etc as with the 68k machines. There should be very little need
>>for rewriting anything (except assembly stuff, obviously).
>My simple mind can't grasp this either.... do you mean that TOS will run in
>native PPC-mode? what about MiNT and MagiC? will the Tempest card feature an
>adapted TOS version?

I was talking about rewrites/ports of application software. Whether the
OS is running natively or not is of no consequence then.
Calling for example the AES from PPC code would be no different from doing

it in 68k code, except for the actual instructions used.

The latest version of MagiCMac is not available in English, why System Solutions decided not to translate and distribute *any* version of MagiC 6.10 is something you'll have to discuss with them...

However, transforming the German version into a workable English version is relatively easy... once you've installed Jinnee and a suitable keyboard driver, you'll only occasionally will come across some German text, but nothing serious... really ;-)

Cheers from Belgium
Dennis

...
>But isn't the PPC a RISC and the 060 a CISC? So aren't 200 MIPS of
>simple instructions less powerful than 110 MIPS of complex instructions?

They wouldn't be in most cases even if this had been a case of actual
'millions of instructions per second'. As I stated, however, this was a
Dhrystone 2.1 benchmark run, which means that the 'MIPS' number is the
number of times faster the machine in question ran compared to an ancient
VAX (an 11/780, I believe). IIRC, the VAX was in its time supposed to be
a 'million instructions per second' machine.

200 Dhrystone MIPS are indeed exactly twice as fast as 100 Dhrystone MIPS,
regardless of the actual processor. Then again, Dhrystone is not a
terribly good benchmark to begin with. ;-)
See my other recent post in this thread regarding SPECmark numbers.

Anyway, while you certainly should not expect a RISC to do quite as
much work per instruction as a CISC, the difference is often not worth
talking about (which was one of the main points about moving over to RISC
architectures (which even modern CISCs (x86 that is) use internally)).
The program code will usually be larger, though, so an equal sized
instruction cache might sometimes give an advantage to the CISC.
As Sven mentioned, the PPC also has some really complicated instructions
(for a RISC CPU), which is one of the reasons why it's so far behind the
x86 variants in clock speed.
The SPECmark numbers can be interesting if you want to get some kind of
idea about how 'efficient' various kinds of CPU architectures are.

Wipe over the rollers and any other frictional bits with cotton wool
moistened with meths. The "dressing" on the paper tends to give the rollers
a "glaze".

Sorry but I think I'll pass... and if you got any sense then you should hold on to your Milan...

Although there's supposedly a survey going on to find out what the people out there would *really* like, judging from the article I would say that they've pretty much decided already how the Pegasus will look like. A TOS 3.06 based computer running on a Coldfire of which several people here explained us why this is not a viable option...
Looking at the specs I would say that all you need to do is get the 68060-expansion kit for your Milan, and it will outrun this piece of vapourware for many years to come....
Think about it, a computer with an AGP interface that is sold with a PCI graphic card... LOL

How someone like Freddi Aschwanden can make a statement like " Firewire isn't needed since the motherboard has USB 2.0 ports" goes simply beyond me but do strenghten my suspicions that the Pegasus project is nothing more then an early april fools joke...

Cheers from Belgium

>said than done i would have thought!.
Spot on...

Use an *older* version, mine is v0.95 from 21.07.1995 and still works :-)

Cheers from Belgium

Hi,

X>More serious is the fact that the 0.97beta will not accept the same
X>registration details as my registered 0.95.
I did not encounter that problem at all. I think you registered the
colour version? For the 0.95 it was possible to register b/w or
colour.

The registration data is to be found in ZEIGSMIR.INF (maybe the
configuration file of the English version bears different name). In my
INF file there are two lines beginning with
User_Key=
User_Colkey=

Und TTschï¿½

Hi Jerry,

>ASH supply the German version of 2.8. You use the english resource file from
>2.7 as there were no changes to the interface
There were no changes to the RSC itself, but there were several made to the
RSC and MDL files from various programs in the modules folder. I should know
because I've translated them... using the 2.7 translation expect CAB behaving
very weird at given times.

The CAB 2.8 demoversion on the ASH website comes with the official English
translation, alternatively you can download the translation from the DDP
website (see sig).

>My reason for sticking with a Falcon accelerator is that the Milan or
>Hades are TT clones rather than Falcon clones. Maybe with a Desse card
>it would help, but there's nothing like having a real Falcon for that
>software that doesn't like clones.
The Deesse card? this is about the worst example you can give... just like
all the other vapourware of that brilliant mind it never appeared. What can
possibly make you think that it will be any different with the CT-60 ?
Except for wild dreams that made a lot of people drool what has that guy
produced since he left Centek?

The other proposed board "Tempest" will be designed by people I personally
believe a lot more then that French dude... but anyone ordering a Tempest and
sending a check to Cortex needs his head examined... unless ofcourse you'll
take the chance... according to the horror stories I've read here I would say
that your chances are below 20% of getting something in return.

Cheers from belgium

Hi Uwe,

>This article is the greatest nonsense I've ever read.
I fully agree... but then STC is specialized in publishing that sort of articles. The last couple of years I've read some very remarkable things in that magazine....

Some highlights from the article:
- Although nothing has been outlined yet, Freddi doesn't expect any serious problems, designing a new computer is dead easy, he's convinced that he can do this in a couple of weeks. He expects the Pegasus (project name) to be available in april.
- He's going for the Coldfire simply because this is the successor of the 68060 and three times faster (are you reading this Sven Karlsson?).
- He realises that the Coldfire lacks an MMU and FPU, but since these are missing on several other TOS machines also this is not a problem.
- He's aiming for USB 2.0. There's no need for additional Firewire since USB 2.0 can handle 60MB/sec.
- The standard OS will be TOS 3.06, because he knows it very well.
..... etc ;-/

I really know this fear well. However, I finally got past it.

Fredi at Medusa sold me the board directly. There is a language
problem, I don't know german but I managed to get the order placed
via e-mail, paid via direct bank transfer. Fredi was very prompt
on shipment also. I based my decision mostly on what others
had to say about their dealings with Fredi. Fredi tries to answer
all my questions, even though the language barrier is pretty high.
I only saw a Hades060 once in my life and at the time it was
running just Photoline, never even saw the desktop. ;-)

The only thing I can really say, is if you have a TT then the
Hades060 is pretty dam cool. More or less it's a TT on steroids
with some nice extra features added in.

Hi there, I've just got a Falcon from 1993, with Tos 4.02. I know that
the last tos for Falcons was 4.04. Can I update my TOS without buying
the chips. Is there a big advantage to TOS 4.4?
Thanks for any info.
PS I really want to use Cubase or other HD recording programs on this
Falcon, I don't know if the TOS makes a difference in this respect.

There is the advantage that you won't trash the FAT of your D:-pertition
when you fill up C:. An old bug that I believe wasn't corrected until 4.04 -
so an update makes life a little easier... ;)

> PS I really want to use Cubase or other HD recording programs on this

Nothing, actually - but change anyway. It's safer that way.

ASH can now supply you with a full version of that software, currently at
a version 3 level. A really good piece of software although i still keep
interface on hand as it'l do some things that RSM wont.

On the subject of Interface it is apparently now available as freeware
from the authours site.

Yes it works but believe me 0.97b is much better. It supports 32b color mode (0.95 doesn't) and above all it supports long file names (0.95 doesn't). Even file names like this 'this is my picture.gif' are supported. Not fully if you use d&d or loads such a name by means of the AV protocol though.
But as said already, it's a beta and shouldn't be available for the public.

Does anyone know what's the current contact for Chris? I tried his address chrisc@zetnet.co.uk but the mail was returned! =(

Or if anyone knows what kind of power connector (or more importantly where I am going to connect this to the falcon motherboard/PSU) to use I could probably try to source it here in Ireland. Especially with our horrific exchange rate with the UK! (25% markup on all prices... *ouch*!)

Re-install the key should work. I just tested it.
BTW, if you're a *registrated user* you don't need to re-install the key at all. The new version looks to the zeigsmir.inf to find out if you're registrated or not and acts accordingly

Interface *IS NOT* freeware, and AFAIK it isn't available anymore.
Besides it was not on the authors page but on a page of a German chap
who claims he has gotten the exclusive permission of Olaf Meisiek to put
it on his page for download. However if you write to that chap, I can't
remember the name or e-mail address right now, you will get a copy (if
the situation hasn't changed in the mean while).

Yes, you're right ofcourse, it 0.97g but as it's a beta version if
always refer to it as 0.97b.

BTW: Can it be that you put the signature separator (--) yourself. If so
please note that there must be a one (1) empty space after the two "--"
It doesn't work the way you use it.

I've no experience with screenblaster. (I use NVDI 5 on a falcon. With Nemesis and Videl Inside software I get the 800x600 screen resolution I use). However, all this kind of stuff should run _after_ NVDI in the Auto folder.

Make sure NVDI is one of the first things to run in your auto folder if it's not already. This could be a problem.

Cheers,

Jerry

> Do you know specifically what bugs were exterminated?

My German isn't great but here's what I _think_ the supplied readme.txt file
says on this subject :-P

```
-----------------------------------------------------
Changes in V2.8 (14.11.1999)

Bugfixes:
- <BASE TARGET="xyz"> for references like <A HREF="#blah"> was not being
observed
- It was possible in forms that a Base-URL (BASE-tag) would not be evaluated
- Entries in the "never accept" list of the "cookie" dialogue were only
accepted when the list was scrolled after the entry was made
- The clipboard will now be searched for both "SCRAP.TXT" and "scrap.txt"
- Four-digit numerical HTML entities (e.g. &#0187;) were not recognised

New features:
as above and in previous posts
-----------------------------------------------------
```

Hope this is of use!

Cheers,
Jerry

PS: I've occasionally run into the 'runtime error' too... It happens usually
during table formatting... perhaps some deepseated bug in the program? You can
quite easily trigger it by clicking the STOP button while formatting a larget
HTML table! :)

Anybody,

Does anybody know of a program that will burn cd`s on a 1040st with
2.5 megs? I think I have one but I wanna be sure that this is the
right program and whether or not it will work on my computer as well
as how to use it???? If you want you can send your comments or
answers to my e-mail address which is firest@williams-net.com

Thanks,
Carey

Hmmm. So from recent posts here would you suggest I send an order to
ASH via snail mail and obtain the German versions of MagicMac and
Jinnee followed by the Jinnee .rsc file for the English language?

Awkward, but if that's the only way to do it...

BTW, of which keyboard driver do you speak?

Not really. The serial network port is simply a serial port, and
AppleTalk was never written for the Atari. That said, you can use the
port under STing (so I've heard) to set up a network of sorts.

From: Colin J Denman <spam@cjdenman.freeserve.co.uk>
Message-ID: <t5d0p9j2m5jj20@corp.supernews.co.uk>
Source record: 52237

There is a utility called WP2RTF which can convert files on the PC. It runs with a configuration file similar to the 1stWord printer config file. Indeed I recently used a config file to convert some old 1stWord docs, but I converted to html (which can be loaded into MS-Word if I wish). An elementary rtf may be possible as well, but there are limits on the initialisation strings in 1stWord config files.
I can't recall if 1stWordPlus has a print to file option, but if not, you will probably find 1stPrnt will operate with a number of command line options, one of which is the printer name, but can be any other file name (CON: produced an interesting and unexpected result -- a window opened to display the output).

Hope this helps,

Go to B&C Computer visions www.myatari.com

or Best Computers. Don't have the address handy. Just GOOOGLE.COM it.
They have Mouses.

For software, there are plenty of FTP sites. If you are looking for
MIDI software, just go to my site. Remember you will need to download
onto 720K Dos-Formatted discs. Read my Download Faq.

Welcome to the world of Atari!

Does it pay to drown your money into Atari software ? 80% or more is German versions anyway. Isn't it better to go and buy a Macintosh G4 ? I think most people treat Atari as a hobby nowadays, I do so. But it is cool to see how much more can you squeeze from 16Mhz Atari Falcon. Its pretty amazing sometimes. Here I have one question - if you buy Magic and Nvdi and all those cheesey programs won't they slow your Falcon too much ?
Then you'll need to upgrade to 14mb Ram which in "real world" would cost you what, $20 ? But for Atari $100+ then if you need some kind of accelerator its another $300+ and if you sum it all up it comes to a nice Macintosh G4.

Artur

the reason atari stuff is so expensive is because there's no demand for it, sure you can get a PC or a mac for much cheaper, Atari's are way past there useby date and are only used by atari fans nowadays.but they are still fun to use and aren't sterile and "all the same" like pc's.. I find it a challenge to get my atari to do things it was never designed for, on the PC there is no such challenge..

Yes.
SB-Software doasnï¿½t found the .sbr files in screenblaster sb_res folder
after nvdi 5. You shoould try to get the latest software release of
screenblaster from anybody near you. years ago a patch was around here
tht fix that problem. I got the patch from the german maus bbs @b3
Iï¿½m not sure it is somewere else around.

Load sb before nvdi starts.

For faster service, Please direct all replies through E-Mail to Ben at:
atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
am swamped and I find it hard to keep up with reading the NewsGroups.

Wanted: Mega ST4. Willing to pay up to $100 U.S. Read on if interested!

Looking for an Atari Mega 4 ST. Please, no upgraded Mega 2's. I need a
stock 4 MB Machine Plus a TOS 1.4 upgrade would be nice. The important
feature is this. The built-in floppy must be the Chinon (I think that's
the name). You can tell, the drive has an eject button centered under
the slot of the floppy. The button is wide, short and slanted on both
the left and right side. And the case needs to be unaltered, not cut up
to replace a drive with an incompatible button. Mega 4 ST with a bad
floppy considered? As long as the case is right. Please direct your
reply through E-Mail to bensmith@teleport.com or call Ben at:
(503)256-9974. I need to keep this transaction solely in the U.S.

P.S. Some have asked me "Why do you insist on a Mega 4 ST? Why not a
Mega 2 ST upgraded to 4 Megs?". My answer, I had a Mega 2 upgraded to 4
Megs. The upgrade failed and I don't want that again. I don't care if
Jack Tramiel himself upgraded it and Guaranteed it. I wan't the Mega to
come that way from the factory. I don't trust most of other peoples
tech work. I'd rather have the RAM put in at the Factory.

Hi,

You can find on my Atari page a new version of my MIDI to MOD converter.

It's now possible to convert to XM and GT2 formats.

The program's history can be readen in the on-line documentation
(in english and in french) for more informations about improvements
and bugs fixes.

This program doesn't currently work on ST computers.
Sorry for the people who tried to use it.
I will try to make a version that works on these machines
but it isn't sure.

http://perso.wanadoo.fr/ckb/atari.html

Happy New Year !

Clement

>I imagine a TT with the 19" monochrome monitor and a laser print would make a
>really nice DTP station. What relevent software is available for the Atari?

Current top contenders would be Papyrus and Calamus, but there are plenty of
others. HP laser printers are widely supported by most programs.

TeX is available for the Atari, but I can't comment on it as I've never had
cause to use it! :-)

They try to be too clever for their own good, and thus make it impossible to
get on screen/paper what was intended. Very, very frustrating.

Hi,

I am a new Falcon030 user, in my AUTO folder I load JPEG.PRG,
MOUSEACC.PRG,NVDI.PRG then SCREENBL.PRG and WDIALOG.PRG... How can I put
NVDI as first program?

Are we talking serial (as in modem) or LAN port on the Falcon? ATM I use the LAN port on the Falcon with Connect to the serial port on my Mac with Black Night and transfer files between the two. I'd love to get StinG working through AppleTalk so I can have the Falcon online as well as the Mac.

Chris (with G3 Mac and Falcon)

If you are in the UK then I have software and hardware for sale, as well
as a public domain, shareware and licenseware software.

Although UK based, I will ship anywhere in the world.

My web sites:

www.the-asx.co.uk
www.last-pd.co.uk

These will be updated as I get back to normal due to a few months of bad
health:)

Well several annoying problems have been worked out of my CAB.OVL.
There is now a version 1.4102 available at my website.

http://www.netset.com/~baldrick/ovl.html

Mostly just patches for CHUNK encoding that wasn't decoding
properly.

More in the works, news will follow.

Dan Ackerman

I have just acquired a Yamaha CRW8824E (internal ide version) which I
am using with Anodynes CD Suite. I have only written 1 CD-r with music
and 1 CR-rw with data so far but it seems to work fine. This is in a Milan.

I originally went for the Soundpool software but they were taking
so long to supply it I switched to Anodyne and I'm glad I did.

I the drive from Simply computers in GB as they would supply a brown
box version with no WinDOS software just a drive and 1 of each disc
type. Not even an IDE lead but it did only cost 126 quid inc postage
and VAT.

Magic and NVDI do slow the processer down a bit, but you wouldn't
notice it. It's worth it though as you can run more than one prog at
one time. Thanks to NVDI graphics are sped up. Just over two times
on my STe.

329. PC serial mouse

Newsgroup: comp.sys.atari.st
Date: 2001-01-06 16:11:13 UTC
From: Jonathan Tranter <jonathan@wolves4chopswestbrom2.com>
Message-ID: <pg7jQJAhO0V6Ew+e@hulkmustsmash.clara.net>
Source record: 52155

Hi everyone!

I'm having a problem using a serial mouse with my Falcon using Genmouse. I've tried three different mice: the Microsoft one just flies around the screen randomly (at any speed setting) and activates the left button occasionally, the second mouse sort of does the same but slower, and the third one does nothing. Changing the mode through Genmouse from MS to Logitec seems to make no difference.

Has anybody else had this trouble and come up with a solution, or are there any other similar programs that I could try?

Cheers!

Jonathan

330. CAB.OVL 1.4100

Newsgroup: comp.sys.atari.st
Date: 2001-01-06 16:17:00 UTC
From: Eick_Wagner@ki.maus.de
Message-ID: <200101061717.a5935@ki.maus.de>
Source record: 52169

Hi,

I love Dan's CAB.OVL, because it has a very good cookie support. But after being offline for some months, it's not possible to start the 'download' or 'autosurf' modules of CAB with the actual CAB.OVL (any 1.4x version).
I use STinG 1.26 with MagiC 6 on my Falcon030, the only accessories I use are ST-Guide and COPS.
Download and autosurf work fine with the CAB.OVL from Olivier Booklage or when using IConnect and the original CAB.OVL from ASH.
But I want:

1. to use STinG

and

2. to have a very good cookie support and further development like with Dan's OVL. :-)

Any help would be appreciated.

Thanks in advance.

Ciao, Eick

From: rand@cd.chalmers.se (Johan Klockars)
Date: 5 Jan 2001 14:41:23 GMT

Hi Johan,

>Like all benchmarks, the numbers depend on the system, of course, as well
>as the compiler that was used.
>On todays chips, the compiler can make a huge difference.
Possibly... but I think that the used configuration has a lot to do with this
as well. I assume when benchmarking a 603 it will be seated on a motherboard
with a bus tact of minimum 66Mhz, have lots of level2 cache for itself, and
most likely will use 64bit wide EDO DIMM memory... the 68060 on the contrary
will be seated on a by today standards outdated slow motherboard... surely this

must influence the benchmarks?

Considering the bus speed of a Falcon, how much speed will be lost? how much
power does the 603 loose when there's no level2 cache onboard, how much of a
bottleneck will the slow harddisk interface be? Unless one forks out extra
money for an Eclipse card what kind of bottleneck will the Falcon build in
graphics prove to be? Taking all this in account, are you still so sure that
the Tempest card wil be twice as fast as a Hades? After all, that's what the
topic was all about.... a Falcon with the Tempest *will* be faster then any of
the existing Atari clones...
You've convinced me more or less that the 603 is faster than the 68060, but
between processor speed and computer speed there's a whole lot of difference.

>>To put it bluntly: in my book all this benchmark number crunching is strictly

>>for the fanatics.... I like "the everyday use" benchmarks a lot better, i.e
>>how long will it take Photoline to rotate a 10MB TIFF, how long does is take
>...
>But when we don't have a machine to try those things on, there is little
>choice but to go on the numbers one can find on the net. Those are
>generally 'standard' benchmarks of various kinds.
Most Apple magazines like to use the "real life benchmarks", these carry much
more weight for the average user.... for most of us things like MIPS, integer
tests, floating point tests...etc don't mean a thing. What we do understand is
the difference in time between two computers packing 10 Mb of data into a zip
file or the time it takes them to display a very large JPEG...
Stick a G4 on a lousy designed motherboard with an outdated graphic card, give
it barely enough memory to run the OS, take away all the cache memory, and
replace the fast harddisk with an extremely slow one, you know just as well as
I do that the "benchmarks" will look completely different... the described
setup corresponds in many ways to a Falcon with a Tempest accellerator...

>Processor/speed SpecInt95 SpecFloat95
>68000/16 0.14 0.16
>68030/33 0.42 0.49
>68040/40 1.16 1.31
>68060/66 2.18 2.33
>601/110 2.66 3.59
>603e/200 4.40 2.80
>603e/300 7.65 6.10
>604e/300 13.20 9.40
>G3/400 17.60 12.20
>G4/500 23.78 22.67
What I find interesting is the speed of the 601/110Mhz, this processor doesn't really differ that much with the 603, but since it's older it will be tested on

a more "realistic" level. With realistic I mean a motherboard and system that matches the Hades and Milan boards somewhat...

>>I'm probably wrong because retrieving information from such slow media would
>>only cost time...
>
>It was mentioned earlier by someone else that the translated version was
>written to hard disk. Certainly, this must be read back again next time,
>but that would be done when loading the program. Once it's in memory there
>will be no extra delay, of course.
I see...

To conclude this: I really hope you can pull it off, and even if the specs turn

out to be a little over the top, it would still be a very attractive option to many falcon users, but what about the distributor? is it really so difficult to

find another partner then Cortex? most of the people here are shivering at the thought of having to deal with that firm...

Cheers from Belgium

Hi Franck,

>Is it possible to get more than 256 colors on MagiC PC6.1?
>And how to get TrueColor mode, if it is?
Yes but then you've got to install NVDI, preferably version 5.0x. With
NVDI installed you can get TrueColour (16 million) in any resolution that
the graphic card in the PC allows...
Installing NVDI will also speed up MagiC-PC considerable and you'll be
able to use TrueType and Postscript fonts in programs that accept these.

For some additional info and a small FAQ take a look at the MagiC PC
section of MagiC Online. http://magicos.de

Hi Lonny,

>This is also my concern. Pity the website, or articles do not
>give clear indication about the exact CPU arrangement. It happens
>to effect how one might react, or at least it does me.
Well, the article in the German STC magazine is very conclusive:

Q: What processor will be used in the Pegasus?
A: The new computer will use the Coldfire processor from Motorola. It is the
68060 successor.

Q: Why have you choosen the Coldfire? Isn't the PowerPC a more logical step?
and what makes the Coldfire so interesting for an Atari clone?
A: The Coldfire is software compatible with the 680x0

Q: How fast is a Coldfire "Atari" compared to a Hades060?
A: About three times faster.

Q: Is the Coldfire compatible with the 680x0 range? what parts are missing and
should perhaps need to be emulated?
A: Missing in the Coldfire are the FPU and MMU. Since these parts were missing
in many of the previous TOS based computers I expect no problems. The hardware
ofcourse is not compatible to a ST or TT, but since the Coldfire has extended
debug facilities hardware emulation is possible.

The complete article is three pages long, and contains even more nonsense. If I
find some spare time this weekend, I'll translate it completely, if you thought
that the MilanII announcement was amusing, well you aint seen nothing yet...

Hi Galen,

>OK. How exactly do you order it for US delivery.
Get in touch with a German Milan dealer that accepts credit cards and ships wordwide... do not worry to much about the language barrier, just write in plain English...
In my experience German dealers understand English very well, especially when it concerns ordering goods, when it's about complaining or asking difficult questions then usually they don't understand you. But this is a worldwide phenomena... ;-)

Personally I can recommend Seidel Software Service, goods are expedited quickly and the payment was always exact to the last cent...

There is an older program called serial mouse at the umich
archive. I've had great success with it on my STBook. The one problem
I've had with it is some games didn't recognize that it was there.

My guess is that its the output from some cgi that doesn't have an
extension on it and CAB is just supplying that ending. Kind of strange
character to supply but it wouldn't surprise me. There are times I've
seen where CAB is expecting something and doesn't get it and doesn't
provide termination onto the string that it passes the OVL. Been sorting
a few of those out that cause problems.

From: bindon@madasafish.com
Message-ID: <t5eplsktu7rn6a@corp.supernews.com>
Source record: 52175

Hi,

Got some problems with SMU. It's the first time I've tried this
program and it's a bit of a bugger to get working!

I've set Magxdesk up as an AVserver and also set my $HOME directory up
in the magxdesk.inf file. They all seem to be working as it's not
complaining. I then used SMU setup to make mu start.set file. That
went OK too. I then put XMEN_NGR and START in my Magic Start
directory. That seems fine too as when it boots the start bar apears
in the bottom left corner.

I put my start.set in C:\User but in seems
as if SMU can't find it as the Start bar is "greyed" out and the test
function in SMU setup reports "Could not find SMU" Anyone know what's
up?

Actually I've just put start.set in the start folder and it works, but
you're supposed to put all defaults in one place to be "elegant"
according to the hyp file which I understand. So it looks like it
can't find it in the user directory. I must be doing something
stupid.

Nope. Missing env vars will just disable certain features.
For example when I test it under singletos, where I have no
env vars set, it works fine. It does not work with iconnect
and/or ifusion installed. Mail to the ifusion author went
unanswered.

What do you mean, "cheesey"?
Bitstream was highly impressed by the
speed of NVDI's font-rendering engine,
for example. Atari users have had the
privilege of some extremely talented
developers but are generally too ignorant
to realise it.

> Then you'll need to upgrade to 14mb Ram which in "real world" would cost

You're not in the real world if you
expect Atari stuff to cost the same
as PC and Mac in this day and age.
Too many Atari users want something
for nothing.

Get yourself a 2.5"->3.5" convertor,
only cost a tenner or so. I prefer the
Lindy ones. I've also used them at
work the other way round, to recover
laptop hard disks by connecting them
to a desktop machine.

> Does anyone know if such a drive can work with the falcon, or if it's

> They said P3 & Intel mobo are lock and not OCable,

Bah, Intel's locked core clock multiplier
is easy to defeat - in your case you've just
got to make the board run at 133MHz FSB,
so with a clock multiplier of 7 (700MHz being
a 100MHz FSB) there's your 930+ MHz.

So how did you crack the motherboard
clock setting? Is it a BX, 8x0 or 815?

> even the OC usenet group says that <grin>...
> but mine is OCed & on stock HSF (even at room temp 30C).....

Even in Singapore?? That's good.
Just make sure you don't OD on
your OC or you could end up needing
a liquid nitrogen dispenser.

Hi Galen

Thanks for the tip! I have been looking at scanners made by Epson and Mustek recently in the hope of getting an old one that would work with existing Atari scanning software! No joy yet.

Does anyone know what the "Transparency" modules do on these scanners? Can it be utilised by Atari s/w?

>.
Hi Jerry,
My system (Falcon MKI/14meg/single TOS 4.04/NVDI 5.01) seems to have
decided to replace the runtime error offset with a CAB 2.8/WDIALOG crash
in your above case!!! Sometimes WDIALOG recovers but most times not.
I believe it's WDIALOG related since CAB crashes again when it reaches
that program in the loading process. Howeveer, it has'nt crashed or shown
an offset on it's own yet! Maybe it will now that I've mentioned it!
(:->)~

Hi Lyndon

>Magic and NVDI do slow the processer down a bit, but you wouldn't
>notice it.

No they dont, In actual fact Magic and NVDI make the system faster
overall, by providing optimised assembler routines to replace klunky C
coding.

>It's worth it though as you can run more than one prog at one time.

No arguments there!.

It's a hardware issue as you state.

>CBHD, I think this has been converted into English (was German)

The English translation is on my web site (MISC section, URL in sig).
It's not a complete translation, but there's enough to get it working.
Personally, I didn't find it to be very straightforward TBH.

I can now exclusively reveal that I've got Olaf's permission to release
the English resource file for Interface. However, it is NOT yet available
for download because I have to check to see if I have the correct version.

One thing that is holding this process up is that the ZIP archive of
Interface is password protected, so until I can get a key no further
progress will occur.

I downloaded Interface this evening, so it is still available FWIW.

Grab Videlity (which was released into the PD a while back, sorry I've no
URL but it might be on the Chapelie FTP server). Install it and configure it
for an external clock, I think that it's 50MHz?

You might also try Centek's screen res expander, but I don't know whether
that is capable of working with an external pixel clock.

Message-ID: <3a57ab94$0$174@news.zetnet.co.uk>
Source record: 52193

Forgive me, guys, as a non-programmer, but would any game programmer help me here, please.

I play few computer games (Yukon, Patience, Shanghai, etc) but am puzzled by the process/algorthithm/whatever that throws up the subsequent games screens after the first.

I mean: it very soon becomes obvious that the repetition of the game in question either can/may be solved or can not at all. Shanghai and Yukon are the most obvious examples.

Evidence is the appearance of patterns recognised from preceding screens.

Is there not a more updated randomize algorithm than used by previous games? (If 'algorithm' is the right word.)

Happy New Year to all,
Charles.

One big question. Do you have a clock on your computer? A real
time clock with a battery backup (such as a TT or Falcon or a hard drive
controller witha clock)?

The reason I ask is that alot of programmers use the system clock
as a seed value for the random function. You used to see the question
alot when ST's were more common, since people didn't worry about the time
and didn't always have a system clock. In these cases you could almost
guarantee repeats of random sequences based soley on the fact that the
system time was almost always the same on a machine within a small
variation. The trick used then was either to get a system clock or to set
your system time to something else before you played a game that exhibited
these symptoms.

If you do have a working system clock that keeps time whether your
system is on or off, then you have a very odd set of coincidences going on
if you are seeing consistently the same performance across a wide range of
programs.

Hi...

I have a 1220S with the transparency module on my PC at work. It enables you to scan slides and negs, but I don't know if the Atari software will recognize it. The Umax PC software detects the transparency adapter (which is a backlight built into the lid) and allows you to select "transmissive" rather than "reflective" as a scan mode. We paid $180 just for the adapter a few years back, but it's never worked reliably... the pulley that moves the backlight gets stuck half the time, although I can usually get it to work after a bit of aggravation. Certainly not worth $180, but if it's cheap enough, why not...;-)

It's just an attachment that lets you scan slides, which are essentially
transparent. Shouldn't be a software issue AFAIK.

Hi Jonathan,

I have connected a serial / PS2 Logitech Pilot mouse with my Falcon
on the LAN port (because the serial 2 is used by my modem). The driver
GENMOUSE 2.6 works fine. My congiguration is:
Connection: LAN
Protocol: Logitech
Speed up: 13
Dynamic: 1
Smooth: on, 200
With this values I have the same results than my old mouse.
I use the driver under TOS 4.02 and MagiC 6.

For info, it's easy to connect a serial/PS2 mouse on the LAN port:

Logitech Mouse
LAN/RS422 Serial & PS/2
++++++++++++++ +++++++++++++++
+ 1: HSKo +------------->-------------+ 5: CLK (RTS)+
+ 2: HSKi/CLK+ | Power source 1 + +
+ 3: TXD- +------------->-------------+ 6: N/C (RX) +
+ 4: GND + + +
+ 5: RXD- +-------------<-------------+ 2: N/C (TX) +
+ 6: TXD+ + Power source 2 + +
+ 7: GPi + 7 Atari mouse port >----+ 1: Data(DTR)+
+ 8: RXD+ +-------------<-------------+ 3: GND +
+ Blindage +------------->-------------+ Blindage +
++++++++++++++ +++++++++++++++

Mini-din PS/2 type:

6 5
X

4 X 3

2 1

1: Data
2: N/C -> TX in serial mode
3: GND
4: VCC 5V
5: CLK
6: N/C -> RX in serial mode

Mini-din LAN/RS422:

8 7 6

5 4 3

2 1

1: HSKo Output hanshake
2: HSKi/CLK Input hanshake or external clock
3: TXD-
4: GND
5: RXD-
6: TXD+
7: GPi General purpose output
8: RXD+

It's possible to use the original mini-din PS/2 mouse if you cross
the wires inside the Logitech mouse.

Regards,

Didier.

I have found ataboot and the kernel 2.1.120 for the CT2 at this adress:
http://www.geocities.com/SiliconValley/Bay/1209/linux.html

I use Debian 2.2 but the kernel 2.2.x of this distribution causes problems
with Xfree, so I use the 'old' kernel 2.1.120.

Regards,

Didier.

I know I've been through this before, but what model is that and does
it come with a PS2 connector with an adaptor for PS2 to serial?

Hi Derryck,

DC>I don't understand what you mean about deletion, is it something that
DC>we should be aware of when using Optimizer?
Not at all. He just had made a mistake in a dialog box; he had denied
twice where a single denial would have been correct.

Something like: 'there were no undeleted clusters found' instead of
'there were no deleted clusters found'.

And it concerned the German version only. And not the behaviour of the
program, but only the dialog box!

I even did not spread this corrected version here in our country. If
and when there will be an update, you'll be the first to get it for
translation purposes!

But as there is no complain, the soft should be working properly all
over the world. Any comments, complains, suggestions, corrections are
welcome.

Und TTschï¿½

Hi Lyndon and TXG

>>I am a new Falcon030 user, in my AUTO folder I load JPEG.PRG,
>>MOUSEACC.PRG, NVDI.PRG then SCREENBL.PRG and WDIALOG.PRG... How can I
>>put NVDI as first program?

>You'll need either Autosort of Dirsort, either will do, should be on
>*all* the Atari FTP sites.

Or simpler still, create a directory, say called swap.

Open a window to this and the AUTO folder.

Copy everything into it from the AUTO folder,

Delete everything in the source directory after spending at least 20
years double-checking all got copied.

Delete everything in the source directory.

Copy everything back singly in the order of your choice.

You can now delete the swap directory if you wish or keep it so's youve
got backups of the AUTO folder available in case bit-bugs bite.

I find with SMU that you have to do what works for SMU!!.

Ive been playing with this recently in order to add the DHST protocol to
my system. And i find that if start.set is in a place other than SMU's
directory the DHST dont work, which is weird as $home is where SMU saves
its history files???.

As you say you should be able to dump everythinh into $home, but SMU has
other ideas.

Hi Dan,

> 2. Milan - COMPLETELY AND ALMOST TOTALLY IMPOSSIBLE TO GET IN
>NORTH AMERICA!!!!
> - The same rant that I've seen elsewhere, why can't I
>just buy a barebones mother board with drivers? I can scavenge enough
>parts from our junk room at work to flesh it out very happily.

Just suppose that...
For people living in Belgium, Holland but especially Germany getting hold of a Milan or Milan DIY kit is relatively easy... most of us here have personal contact with each other by means of PM or IRC... in certain cases I imagine one could even use the word "friendship", personally I spend more time here with you guys then have with my best friends... and although most of us will probably never meet each other in real life, you've all become a part of my life... :-)

Considering the reliability of certain dealers and the difficulty of getting the payment across, well, why not use our international contacts?
If someone living i.e the States would like a Milan, why not simply ask one of the people here in which he probably puts more trust? I know I would...

It's still risky ofcourse, but at least you'll know that the hardware will be bought by someone who knows all about it and can check it out before sending it of to the other side of the world. Federal Express will deliver goods COD, the risk of not getting payed are minimal, in the worst scenario, the goods are simply returned to the sender... If a bright light tries to swindle us, his practices will be exposed here, that's probably enough to cut him of from the Atari community forever.
If both parties agree then there's no need for money to change hands at all, in the US a lot of goods are much cheaper than in Europe... If I would like for example a $800 SLR camera with zoomlens and you would like a 800$ Milan, then it's simply a question of swapping stuff. And we'll both save some $500 with this transaction...

> So far the only Milan I've heard of for sale in the USA was used
>and going for $1000. That's just a litle expensive for a 68040 machine to
>me, especially used.
Which in my book is equal to daylight robbery...
A brandnew Milan without Germax VAT (tax) costs roughly $600 , first class delivery with Federal Express costs $95... I suppose you would have to pay a certain amount of import tax and State tax, but it'll never be as high as $300, I estimate something in the region of 15%....

BTW a Milan DIY kit cost $400 without German tax, since it's only a small and light box, shipping costs will be much smaller.

The proposed scheme will not be attractive to everyone, I was merely playing with a thought, call it an exercise if you like... but at least it offers an alternative... others here are welcome to improve and fine tune it :-)

Cheers from Belgium
Dennis

Hi Lonny,

>I tend to think differently, usually I get flack for it.
>I still think the bar needs to be raised, when it comes to coding
>new apps. How high should the bar be? There is a can of worms
>so I won't give my opinion. ;-)
I'll stick my ugly neck out....
There's no question about it... that bar simply *must* be raised, supporting a 15 years old computer is ridiculous. The bar has been raised once when the Falcon was released by Atari itself, there are a lot of nice apps out there that can only run on a Falcon... there's no objection to this because we all know that the DSP is used/needed by these programs, but whatever the reason the bottom line is that people with earlier machines are left out.

I can understand that the commercial programs try to cater for the majority of the users but shareware and public domain programmers don't have to be so strict...
In another thread someone was complaining that he couldn't watch MP4 coded AVI on his Milan, because Aniplayer didn't support this format. Ofcourse it doesn't why would a programmer go to all the trouble implementing this knowing that only a fraction of the users will be able to view films in this format, unless they like (very) slow motion ofcourse.

Dan Ackerman wrote about the catch 22 situation we're in, there is a way out of this, but the programmers will have to do it.. the Hades and Milan have shown that the users are not willing to buy these computers unless there's software available for it.
Suppose you would write that super duper browser that we're all waiting for but that it would only run on minimum a 68040 machine with graphic card... a lot of people would not be happy with this, but some will hopefully be sensible and upgrade to a more powerfull (Hades, Milan, Tempest,whatever...) machine, the next step could be a program that can actually code and decode MP3 in real time, and so on.... If enough people would use a 68060/Coldfire/PPC based machine then the MiNT people would hopefully port some apps of that impressive Linux catalogue as well, the more programs available the more likely it is that more people will upgrade to the new machines... until one day that catch 22 situation is over.

Don't get me wrong, I'm not saying that ST/Falcon/TT users should be singled out, we all know that a bit of clever programming goes a long way on these machines. But they must have an incentive to upgrade... at the moment a newer computer will only run their existing software faster, a lot of people don't bother about the speed and stick to what they've got.

Cheers from Belgium

Hi Galen,

>Hmmm. So from recent posts here would you suggest I send an order to
>ASH via snail mail and obtain the German versions of MagicMac and
>Jinnee followed by the Jinnee .rsc file for the English language?
Yes...
Jinnee 2.5 comes with English installation files, so that's not an issue anymore. If you have some extra spare cash then I strongly advice you to order ASH Scripter also. The combination Jinnee/Scripter will turn your desktop into an unbeatable combination.

You're entitled to one free update of the software, but this can only be obtained from the in Germany located ASH BBS. International phonecalls are rather expensive, it's better to ask someone living in Germany to download these for you and mail them over... it shouldn't be a problem finding and asking someone here in CSAST.
If you bought ASH software in the past, then you're entitled to buy at the "power user" price.

>Awkward, but if that's the only way to do it...
Not really, suppose you've got an iMac or G4 which both don't have a diskdrive then the best way is to obtain the programs by email. Otherwise you'll have a hell of a job installing the programs. Another advantage is that you don't have to fork out money for shipping costs and don't have to wait for snail mail delivering the goods.

>BTW, of which keyboard driver do you speak?
The German version of MagiC Mac comes with a German keyboard driver, so you've got to switch it for a English/American driver.
IMO the most versatile driver available is Keytbl from Daniel Augsburger download it from http://www.jumpgates.com/skydiver

If you like some additional info before you decide do jump in the deep water then just drop me a PM.

Cheers from Belgium

Hi Arthur,

>Does it pay to drown your money into Atari software ?
Yes, definitely....

>80% or more is German versions anyway.
Not if I can help it....

>if you buy Magic and Nvdi and all those cheesey programs won't they slow
>your Falcon too much ?
One of the advantages of using Magic is that it's marginally faster then
TOS and more versatile. Instead of slowing down the computer, NVDI does
just the opposite. The Falcon has rather slow graphics, NVDI speeds these
up considerable...

Cheesey programs? ever looked at what's available for the Mac?

>Then you'll need to upgrade to 14mb Ram which in "real world" would cost
>you what, $20 ? But for Atari $100+ then if you need some kind of

Hi Bob,

>Isn't it sad that so many of the Atari/Falcon etc programs that we rate
>so highly are incapable of giving output to the latest printers. How
>humiliating it is to have to grub about in the second hand market for a
>printer/scanner or some other accessory that will work with our Atari.
>Shouldn't this be telling us something.
It's telling us that we have to keep our eyes open and walk on eggshells
when we consider buying new hardware for our beloved machine...
Remember the good old days when printers featured useless things like
dispwitches and real buttons? you're lucky if there's an of/off switch
on those blasted things these days...

Just try to change the page lenght, font size, character code, etc... on a
modern printer... all this was possible a couple of years ago, but to save
a couple of cents the manufacturers thrown out the dip switches and various
setting buttons. When buying a new printer they throw a Windows driver at
you and that's it... some manufacturers are still aware that there's a
minority that works with a Mac, so the top models usally come with a driver
for these computers also. If you're the persistant type that likes to work
with BeOS, Linux, Warp or god spare us an Atari, you're out of luck...

Last year I bought an Epson 850, which more or less can be configured by
the user without needing drivers, it wasn't a touch of luck, I've been busy
comparing printer specs from different manufacturers, until I finally found
what I was looking for. I don't care how good HP printers are... without a
PC/Mac the user can't even calibrate the heads...

Programs that come with their own drivers should be avoided at all costs,
if there's one good thing about Windows then it's the printerdriver. All
programs use it...
We've got something similar: NVDI and SpeedoGDOS. I for one will not invest
in a modern Atari program that doesn't allow the use of this system. And
anyone claiming differently needs to visit his doctor. You're very fond of
DA's Layout but can't use it anymore because the programmer(s) left out the
option to use SpeedoGDOS... there must be hundreds of sad examples like this.

A printer should at least give the user the possibility to print pure ASCII
text, without needing any drivers at all...
If one can't change the pagelenght, typeface, cpi and emulation mode on the
printer itself, I would say don't even touch it with a bargepole and most
certainly do *NOT* buy it...

Cheers from Belgium

Hello Mike!

MK> I've used a Falcon and 15" SVGA monitor and Laserjet 4
> for the last few years and it's been top notch.

Sounds great! Out of interest, what resolution do you run your 15" monitor at?
Does it have a visible diagonal of about 13.5"?

MK> I actually purchased for 3 pounds a full copy of
> Pressworks for the PC this week so that I could load
> my old Timeworks DTP documents into it.

Does your version of Pressworks run under GEM or MS-Windows?

MK> TeX was available for the ST, I almost installed it,
> but never had the time to learn it, so didn't bother
> in the end.

I can certainly relate to not having the time to learn it. I might make the
time to learn Texinfo, which can produce TeX source as it's output. The basic
idea of Texinfo is that you produce both on-line and printed documentation from
the same source file.

MK> It's when we all fall for the marketing hype/con trick
> that causes the problems!

I'm immune to marketing, at least so far as computers are concerned.

Hello Chris!

C> Are we talking serial (as in modem) or LAN port on the
> Falcon?

I meant the LAN port.

C> ATM I use the LAN port on the Falcon with Connect to
> the serial port on my Mac with Black Night and transfer
> files between the two.

What kind of transfer rates do you achieve? Is the connector and pinout the same as that of the Mac? If it were I guess I could use a regular Apple serial cable, (otherwise I might have to break out the soldering iron ;o)

C> I'd love to get StinG working through AppleTalk so I
> can have the Falcon online as well as the Mac.

I never did have a really solid grasp on how LocalTalk is used for TCP/IP (on Macs), I get a vague impression that IP is tunnelled through AppleTalk, but I could easily be wrong. I have a suspicion that it might be more simple (if a little less fast) to set up a SLIP or PPP link to the Mac, and have that running as a router. Come to think of it, this might even work with ST, STFM etc. that lack the LAN port. Hopefully someone here will be a bit more clued up than I am regarding LocalTalk.

Regards,
- Andy.

> is the old chicken and egg question. :-)

It seems more likely to me that a minicomputer was used, I think it might be difficult to justify the enormous expense of a mainframe just to program the 2600. Of course I could be wrong.

HR> While the techies are designing the hardware, the
> software guyes already have a emulator running.

How can you emulate what hasn't been designed yet?

Hello Galen!

G> The serial network port is simply a serial port, and
> AppleTalk was never written for the Atari.

I suspected that AppleTalk might never have been ported. I wonder what sort of serial port it is though? I get the impression it might be an RS-422 port like that traditionally on the Macintosh. Perhaps it's RS-485 though.

G> That said, you can use the port under STing (so I've
> heard) to set up a network of sorts.

I'm guessing it's a serial port with 'multi-drop' support then (several computers hanging off the same wire). Or is some kind of external adaptor needed?

> too.

I readily agree that colour (used properly) can be very useful, but I think it's fair to say that there will continue to be people who's DTP requirement doesn't include colour. Even in a colour publication, there are likely to be tasks that don't involve colour.

RT> I know people who also work with Quark Xpress but

Hi,
go to
http://www.climatics.com/Filearea/Showfilessearch.php?searchname=goldrunner&categorie=0

(perhaps your mailsoftware will not display the whole link as link, you have to fix it by hand...)

and download gau_023.zip . Thats the original version of Goldrunner. It runs perfect on STew! and STEEM. (I think WinSTon will run it as good as the others)

Have Fun, Mirko

I think this scheme will be the aboslutely best one. At least now, since
there are no US dealers. Also, this would make you Americans get the goods
at the best price possible.

Well, I know Gembench is pretty useless, but it does only get 85% for
the CPU speed. Overall though (including graphics) it is a lot
faster!

What kind of question is that? It's like asking "if you load that
Peterbilt with 20 tons of beer, won't it slow down?" ;-)

> accelerator its another $300+ and if you sum it all up it comes to a
> nice Macintosh G4.

If cost and speed is all you care about, why even consider a Mac? A
bog-standard PC beats a Mac in all areas - it's faster, cheaper and
there's a lot more hard- and software available for it (and at lower
prices). People buy Macs instead of PCs for very much the same reason why
some of us buy or upgrade Ataris instead of buying Macs - they simply like
the Mac better.

I was content with the speed of my old system, in my mind I
was "getting by ok". I'm still using the TT for onlines uses
and it feels pretty much like slow motion compared to the
Hades. Hopefully I'll have the Hades online soon though.
A couple of tasks have already made me ponder how I
could of ever been satisfied with such slow performance, like
image loading or compiling code.
The downside is there really is not too much specifically
for my Hades. I actually paid slightly less for the Hades
than I did originally for my TT. That still don't justify
the high price tag, but I thought it was ironic in a way.
It would appear atm, the only ones buying these really fast
machines have some specific need for more speed, or are
complete Atari freaks where sticker shock means nothing.
I had hoped the milan060 would of appeared, at least
the price tag was projected to be a bit more reasonable.

Your ideas for DIY purchases seem good to me, someone
could of made a killing selling those over here at the
right time, but now every seems to wait for stuff that
is "in the works".

But only when running native Coldfire code. When running 68k code, the
performance will be quite a bit lower!

But only if Transmeta supplied the code-morphing software for the target CPU
- the VLIW RISC instruction set of the crusoe is not documented, and so you
can't even write your own CPU emulation code without Transmeta.

Especially since not even Intel has USB 2.0 in their current chipsets -
there ist just first demonstration silicon of USB 2.0 out, so designing an
USB 2.0 port on a motherboard at this time seems a bit difficult ;-)

If he works on the hardware full time, that should be possible. However, I
would expect the software adaption to take a bit longer - and from my
experience, you will need modifications to the hardware due to bugs which
you find while writing the software. Even if that part of the hardware is in
some FPGA and is easily upgradeable, you can't *ship* anything but developer
machines in that state.

Hi John,

You are correct of course. It's just one example of how/why democracy doesn't work in practice. We get legislation that we don't agree with and why, because the majority, who don't want it, are too lazy or 'embarrassed' to make their feelings known. It's always the voratious minority that get their way and the silent majority who deserve evrything they get. Politicians know that only the extremists will ever bother to answer a questionaire/poll, but they have the loudest voice and the media love them, so the scum/politicians go along with them, it's a case of you kiss my arse and I'll lick yours.

Yes, ofcourse Transmeta would either document how to write the emulation
layer, or simply add m68k instruction-set support. But I guess neither
will happen...

What model is what, the adapter?? There is only one adapter. He used to
have two kinds, but now only sells one kind. No, the adapter does not come
with a PS2 to Serial adapter. However, the Logitech mouse had one included
and that is what I am using to get it to work with the adapter. Oh, where
you talking about what model the mouse was?? If so, the Logitech is model #
MCV46 and is a MouseMan.

Hi all,
Me and my Father have two ST-Books that are being seriously neglected, so we're contemplating letting them go if it's financially worth it.
They are stock 1 meg machines, and are both located in Montreal, Quebec (Canada)

For more info on the st-book:

http://www.computingmuseum.com/museum/stbook.htm
http://members.tripod.com/~joshuawaller/atari/stbook.html
http://www.backntime.net/Atari%20Computers/16bit/Laptops/FrameSTBook.html
http://homepage.tinet.ie/~morrikar/Computers-STBook.htm

Please send offers to bengy@mac.com

Also for sale, non Atari related, but still interesting (?):

A Hewlett-Packard IPC (Integrated Personal Computer) with all documentation. This is a 68000 based Unix machine, with plasma display and integrated Thinkjet printer. It also comes with an external Hard disk.
The computer and integrated printer weigh about 25 pounds (1985 idea of a portable), the hard disk probably 10 pounds (maybe 15), and the documentation (21 2 inch binders), probably another 30to 50 pounds). (Also in Montreal)

That was my Milan FS here in the USA. I bought it from Woller Systeme in Germany via Credit Card. Took a longtime to ship but I did get it in one piece but with dead RAM, dislogded heat sink, wrong power supply. The math you discussed here is a bit off. I have not checked current conversion rates but here's the way it stood when I purchased the Milan in 12-99. Milan was 1,500 DM which at the time was $.53 US Dollar to DM which works out to $795 US. Shipping I was charged was around $160 UPS Air. I did purchase other hardware and software which added to the weight. So anyone in the USA who wants a Milan can have one for roughly $1,000 US Dollars depending on currency rates at the time of transaction.

Obviously everything is in German and if something is wrong (like my RAM, wrong power supply, no heat sink) or worse being dead you are on your own. I resolved all hardware errors on my own in about a week. One thing I did learn was that the Milan is extremly fussy about RAM.

Oops this isn't very clear. By "seriously neglected" I meant that they are not being used at all, thus going to waste. (they are not being physically abused, just emotionally :-)

Bengy

431. FS. ST to SVGA adaptors.

Newsgroup: comp.sys.atari.st
Date: 2001-01-08 00:12:26 UTC
From: Barrie at Atarispares <barrie@keychange.co.uk>
Message-ID: <VD766.14046$nu5.117268@NewsReader>
Source record: 52049

Hello.

I have decided to supply my hi res mono Atari ST to SVGA monitor adaptor on its' own.

"Big deal" you may say.

The reason I resisted demands for it in the past was that many of the VGA and SVGA monitors, available then, simply were not good enough for musicians running Cubase or Notator etc. who were and still are my customer base.

With the current, wide availability of used digital 15" and 17" SVGA monitors, most of which, BUT NOT ALL, work well with the ST, I now feel able to supply the adaptor.

Unless given a monitor please buy the adaptor before buying a monitor then you can test it.

The adaptor can include a flying cable for sound from the STFM, the pings and dings can be of use.

Price is £13 inc P & P in the UK.

Barrie at Keychange Music Services.

Hi Lyndon,

>Actually I've just put start.set in the start folder and it works, but
>you're supposed to put all defaults in one place to be "elegant"
>according to the hyp file which I understand.
You're not supposed to put these files in the START folder...
Open your HOME folder and create a new one in there, call the new folder
DEFAULTS, that's the place where the START.SET should end up....

Once SMU is running it'll create some additional files which will all end
up in the GEMSYS/HOME/DEFAULTS folder... the complete picture looks like
this:
START.HST
START.INF
START.LNK
START.SET

>I must be doing something stupid.
Not really, the installation of SMU defeats all logic hence the
installation program that unfortunately isn't very logical either... :-/

Cheers from Belgium

Source record: 52071

Hi Neil,

>Thanks for the tip! I have been looking at scanners made by Epson and
>Mustek recently in the hope of getting an old one that would work with
>existing Atari scanning software! No joy yet.
All Epson scanners produced since 1989 work perfectly with GTLOOK II and
the GDPS compatible Epson SCSI driver. (both these drivers are freeware)
All Mustek SCSI scanners up to the still available models ScanExpress SP
and the Paragon 1200 SP Pro work perfectly with the NOVA Mustek driver
(this is a commercial driver).
So I don't see what the problem is...

>Does anyone know what the "Transparency" modules do on these scanners?
>Can it be utilised by Atari s/w?
It's main use is to scan slides and negative film... I have bought one
for the Epson scanner a while ago and I'm very pleased with the results.
The Atari software works like usual, it doesn't make any difference what
the source of scanning is. Once scanned the pics need to be filtered
because they have a strong blue tone and are rather harch, but nothing
that Photoline can't handle...
I've read some articles about the transparency module for the Mustek, and
these were not very positive... perhaps someone here can fill you in on
this...

PS: the Mustek also works on a Milan with a SCSI card, the Epson drivers
refuse....

Cheers from Belgium
Dennis

>StinG working through AppleTalk so I can have the Falcon online as well
>as the Mac.

I've discussed the possibility of such with a few friends before. Sadly, none of us actually own an ST... the focus of our somewhat comical debate was whether netatalk could be could be made to run through the rs422 port on an SGI. The SGI's rs422 isn't mini8 like the Mac's... though that would hardly be a problem. The biggest difficulty would be in matching the signal levels and impedance and such. Might require a non-standard transformer, and none of us were expert enough to say one way or the other.

Providing that it is truly localtalk compatible, it might be worth your while to grab a phonenet adapter for the thing, and try to compile netatalk for the Falcon. Would require a bit of code monkeying, to be sure.

Thanks,
John

There is a small batter behind the internal hard drive. You can
replace it wit a mac battery but you will need to make a new holder for
it. I bought a AA battery holder and cut the middle out and taped it up,
then spliced the end wires to the original batteries cable. First one ran
for 3 years. Should really be better, but then again it was a radio shack
battery ;)

> cool to see how much more can you squeeze from 16Mhz Atari Falcon. Its
> pretty amazing sometimes. Here I have one question - if you buy Magic
> and Nvdi and all those cheesey programs won't they slow your Falcon too
> much ?

No they don't slow your Falcon down. MagiC is a multi-tasking kernel
that will run a single program quicker than single-TOS. Of course you
can do 'real' multi-tasking as well (something Macs are only starting
to cotton onto...). NVDI replaces the TOS screen graphics routines with
MUCH faster routines, and adds Truetype fonts, useful printer drivers, as
long as your software supports GDOS (MOST do), so it actually makes your
Falcon 'faster' by accelerating the screen updates - less time spent on
CPU is the result...

> Then you'll need to upgrade to 14mb Ram which in "real world" would cost
> you what, $20 ? But for Atari $100+ then if you need some kind of
> accelerator its another $300+ and if you sum it all up it comes to a
> nice Macintosh G4.

There is no point trying to upgrade your Falcon to the utter max if you
want G4 level performance. Memory is useful (and cheap, get an empty
72-pin or 30-pin SIMM adaptor and populate it yourself with SIMM's that
I have seen sold for $5 here in NZ...). A G4 mac would be nice for Mac
stuff (obviously) but I like my Falcon software because its unique to the
Falcon...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Sounds like your battery has died. Its located behind hard drive on the right side of the TT. You should be able to open the hard drive
cover and see the battery. The battery can be bought at any electronics supply house like Radio Shack.

Steve's Expose card causes the machine, to lock up randomly, this was setup
by Rudolph too. Pulled it out and now it works heaps better. I think it was
because the expose card had a thru arangement and the distance from the
board to CPU was too great...

According to a snippet I'd seen on the net, the 'new' Coldfire chip does
full 68k emulation on-chip, but what that means to a desktop designer is
yet to be seen...

I still think its RUDE that Medusa need 500 confirmed buyers to continue
past the 'vapour' stage...

> > The Crusoe 500 fells like a Pentium 166 - 200 MHz doing x86, I imagine
> > doing 68k emu it would feel even slower

IBM think the Crusoe isn't going anywhere, because they've removed the
chip from a laptop they'd already been placing it in. The reasons are
that the chip underperformed, and that battery life didn't meet the
expectations, and therefore there were no real gains to using the Crusoe
in that laptop...

All the work to get an 'Atari' running out of a Crusoe might not be worth
it if the chip doesn't perform...

From: Guillaume LE TETU <Guillaume.Letetu-Renexter@renault.com>
Message-ID: <3A59682C.A5CDD58F@renault.com>
Source record: 52070

I recently disassemblied a megafile30 and a I saw there were 2 main
parts inside, a controller and the harddisk himself (30 meg). The
harddisk is connected to the controller by two cables, one of them seems
to be an ide cable. Is It possible to replace the harddisk part with a
standard ide drive (bigger), using only the "ide" connector and the
power supply of the actual one ?

Thanks,

Guillaume.

from memory they use MFM hard drives, the way you can tell is if theres 2 ribbon cables as well as a 4 wired power cable.. 1 ribbon cable is the size of a floppy drive data cable and the 2nd ribbon cable is half the size... In this case you can only install a larger MFM drive if you can find one..

Or the other option is if its SCSI, it will have a 50 pin data cable and a 4 wire power cable.. in this case you can install anydrive as large as you want provided you set it up right and format it etc..

You don't need to change your TOS because all patches exist to correct
the pb. For serial, you need to use hsmodem or something like that. For
hd partition bug, you need to use a good soft for hd (c�cile, hddriver).
You cannot upgrade really the tos: to do this, you need to change the
chip or try a new tos in a file like the TOS 4.92.

```
> PS I really want to use Cubase or other HD recording programs on this
> Falcon, I don't know if the TOS makes a difference in this respect.
Use a basic tos for cubase with minimal patches: no magic, no outside,
etc.

> with BeOS, Linux, Warp or god spare us an Atari, you're out of luck...

It's the market driven economy again. The punters mostly use PCs with
one or other version of Windows
and they want cheap and easy, boil in the bag products. So naturally,
fiddly things like dip switches are out and software drivers are in. If
I were a PC user I wouldn't want it any other way.

>

Hi,

The main problem is if the power supply is hefty enough to actually spin up
the drive.

Hi Dennis,

More pearls from you I see!!

For what it's worth, I totally agree with you. There has to be some reason for a present ST/Falcon/TT user to:
a. upgrade
b. upgrade to an Atari 'compatible' and not a PC or Mac.

If he/she/it is content to play classic games which rely on game play and intelligence rather than ever faster moving cars/monsters/over-endowed males/females and/or keep the simplest of databases, write the simplest of letters and electronically communicate via text only, then there is no need to upgrade at all. A 800XL kept me going at work for 4 years.
The incentive comes when you are presented with data, usually multimedia based, that is either reproducable by the Atari, but at a snails pace, or not reproducable at all. The solution is thus two pronged. Completely new programming to correct the second fault and a faster machine to correct the first. What we Atarians have without doubt, is the best look and feel, ie interface of any computer platform (including the latest Mac), whether it be in the shape of Thing or Jinnee or whatever. I like to think it's the attitude to computers embodied in such interfaces that defines all that is good about the Atarian world and not the hardware. A user doesn't see the hardware, just the interface.
Basically then, I think that any way foreward must sadly be without the constraint of backwards compatibility. There may be game players out there who can keep up with a pac-man sprite on a 800Mhz driven machine, but for those brave souls they can always play 'run across the Free-Way' blindfold, instead.

Bob king.

I just can't take on anymore stuff, I store it all at my brothers flat but there is simply no more room (in the spare room),my brother has been driving around with a couple of hundred of them in his car boot for months now (he is really getting annoyed).

I have been trying to get shot of a big pile of ST Formats and others as they are simply in the way, so if anyone is picking up the STE from South London then maybe they could spend 30 minute longer coming to Tunbridge Wells and picking up lots of mags (free).

Sorry to cut in on your 'sale' there.

Well you can install just about any SCSI drive as long as it is 50 pin
Ribbon and a power you have and not MFM (as David mentioned), IDE will not
work without a new controller.

My brother Supra 30MB drive, using the controller he had 2 SCSI Hard disks
(the 30Mb and a 400mb), a SCSI CD-ROM and a SCSI DAT drive on it and it all
worked with no problems.

The speed difference between the 30mb and the 400mb was massive along with
the size increase the playing around was well worth it.

463. PC-diskette on Atari?

Newsgroup: comp.sys.atari.st
Date: 2001-01-08 15:27:34 UTC
From: Bas Schellevis <V.J.B.Schellevis@Netvance.nl>
Message-ID: <3A59DC66.8546C9B2@Netvance.nl>
Source record: 52089

Help!

We are using an Atari 1040ST for a special purpose (as a control-device for a responsesystem). The results are stored on a 720 Kb pc-formatted diskette and then read on Windows 95. So far no problems. I upgraded a pc to Windows 2000 and now I cann't read the disk anymore. Windows 98 also seems to have this problem.

This is what happens on Win 2K and Win 98;

Format disk in Windows (720Kb DS/DD), Ok
Write files in Windows on floppy, Ok
Read disk on Atari, Ok
Write files on Atari, Ok
Read disk in Windows, *not ok*, 0 Bytes!

How do I read/write Atari-disks on a pc?

Thanx,

Bas Schellevis

Yes, I was talking about the model of the mouse. I bought a Pilot
Mouse which is the cheap end of Logitechs range and that came with a
stylish molded adaptor for converting PS2 to serial for computers with
a serial mouse port. It refuses to work at all, tried everything. I
would check the Logitech cataloge to see which price range your mouse
and what it looks like but , but I put the cataloge in the loft/attic.

Oh well.... :)

466. DOOM on Atari

Newsgroup: comp.sys.atari.st
Date: 2001-01-08 16:16:01 UTC
From: Mark <mark@recycledsteel.co.uk>
Message-ID: <978970650.25546.0.nnrp-04.9e98a620@news.demon.co.uk>
Source record: 52092

I have found the site with the Atari conversions of Doom, Heretic, etc but I can't get the thing to work. I get 2 bombs no matter what I try.

I am trying it on a TT with 4MB ST RAM and 14MB FastRAM, I have tried it in a all colour resolutions, in both TOS and Magic 6.

When running the GTP program I have put in;

nothing
doom1.wad
-file doom1.wad

And a few others (xbios modes, etc)

Anyone have any ideas?
Do I need Linux or Mint?

Mark.

|>Thanks for any info.
|
|
| There is a small batter behind the internal hard drive. You can
|replace it wit a mac battery but you will need to make a new holder for
|it. I bought a AA battery holder and cut the middle out and taped it up,
|then spliced the end wires to the original batteries cable. First one ran
|for 3 years. Should really be better, but then again it was a radio shack
|battery ;)

Just make sure the voltage is correct. Some TTs had 6v batteries,
some had 3.6v.

Well SMU was running fine when the set file was in the START folder,
but I know this isn't the best place for it. I set in magx.inf
#_ENV HOME=C:\USER which is what it says in the docs and then created
C:\USER and C:\USER\DEFUALTS. I put the set file in both USER folder
and DEFAULTS but it doesn't pick it up from either of those locations.

Hi Mark

>Hi there, my TT has started to give me the wrong date and time.

Its probably the internal battery pushing up daisies, but there's another possibility, do you have an external Hard drive and does it have an ICD adaptor. Its time for the batteries on these to die, they are all quite old now..

>TeX is available for the Atari, but I can't comment on it as I've never had
>cause to use it! :-)

Yes, TeX runs fine. There is a "Lindner TeX" package with a shell
program integrating an editor of user's choice, TeX compiler itself,
DVI driver (i.e. viewing/printing) and Metafont (producing fonts at
required sizes). There are provisions for grouping files into "projects",
automatically going from TeX into editor at source line where error
was reported, and for automatically creating missing font sizes.
The port uses TeX V3.1415 and Metafont 2.72, and there are versions for
MC68000, 68020 and 68020+FPU, with standard and "BigTeX" memory
allocations.

I use(d) it occasionally with LaTeX 2.09 though newer macro packages could
be used, too- but, e.g. Latex 2epsilon was too slow. With LaTeX 2.09
compiling speed was similar to that on a VAX 11/780, Metafont was
noticeably slower, but DVI viewing was much faster than on a VAX and,
in fact, quite comfortable. Unfortunately noone bothered to compile a
version for MC68000+FPU (like tha machine I have) which would improve
speed significantly.

am doing 68k asm programming as part of my degree and I thought it would be
useful to practice on my ST.

DjS

You should have been born a bit earlier and
gone to Manchester University pre-1995,
when it had the famous Atari Lab, an assortment
of 48 various STs for exactly this purpose
(teaching 68K assembler). They have now
replaced the worn-out Ataris with PCs, but
are teaching MIPS rather than x86.

Those were the days.

Shiuming Lai

Although I haven't tried myself, all of the above should work, although since you won't benefit from the changes, simple narrow SCSI is probably your cheapest choice. There is a little question of startup commands, however, so Western Digital and IBM drives are usually frowned upon.

Others may have better information than I, but I personally would have no concern placing a 50 pin SCSI 2 drive in my computer.

To clarify, the "LAN" port on the Falcon is just a serial port. It
works identically to the Serial port save for the pinout.

Actually, the "LAN" port IS the Serial port. Both connect to the same
point on the hardware, so you can use one or the other, but I rather
doubt you could use both simultaneously.

I don't know what 'multi-drop' means, so I can't help there. No
external adapter is needed as far as I know. In fact, I've
occasionally run a Macintosh external modem off that port. Just plug
and play!

> 2.5 megs?

CD Writer will. The downside is that you have to have a SCSI or IDE
adapter and the software isn't that cheap. Still, it works great.

Due to a request from an Atari-Midi member, I created a tutorial for
AFSTS (Algorithmic Film Sound Track System) It is now on my site on the
AFSTS page. Just go past the download section.

http://sites.netscape.net/timconrardy/afsts.htm

I woild welcome any comments on this unique software.

Message-ID: <a8nk5tc4cq7s65p69vkh84vp8va1nspc3k@4ax.com>
Source record: 52137

This probably won't help, but I ran into a very similar problem when transferring files between my ST and a PC.

I know how to do it, and it's always worked before, but this one particular time it was driving me crazy.

I could format the disk on the PC, copy files to it, read them on the Atari, copy files from the Atari, put it in the PC, nada. No files, disk unreadable. Put it back in the Atari and there they were. Back in the PC, they were gone. Tried several cycles, same thing, nada.

Made me crazy until - I ran a virus checker on my ST.

Yup, I had a bootsector virus on the Atari which was modifying the floppy bootsector so the IBM system wouldn't recognize it, but the Atari was perfectly happy to read the disk (and re-infect itself).

Cleaned the virus out and everything worked just fine again.

You might want to try running a virus scan on the Atari just for fun.

...not that a good sesh with Lara goes astray now and then! ;^)

I agree wholeheartedly (on another subject!), that there is no point in upgrading to do the same as you did before. My main motivation for buying a Hades/Milan/PPC etc... would be the speed, as I'm heavily into GEM/TOS apps like POV-ray.

Then again with Freddi holding the Atari world to ransom by expecting pre-orders of a dreamlike number, a G3/G4 Mac or Pentium III/Athlon system will be faster again for POV-ray stuff, so that might be the way I eventually go. The failure of most 060 clones, and prohibitive cost of the working ones probably will see to that I think.

Medusa really are dreaming to think XTOS will take off when conditional support is required. Do they even have a working proto? I doubt it. Best advice to Medusa from me is to show us all that they are not bluffing by showing THE REAL THING at the next show...that'll silence me anyway! Until then I remain a critic...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Yup, had exactly that experience myself, more years ago than I
care to remember. Turned out that all the Ataris, except one, in the
UniZH Chem Dept were infected. (The secretary was concerned that the
Professor would be angry that her machine had spread the virus; I snuck
into his office, found that 2 of the 4 diskettes there were infected, and
told her not to worry...)

>You might want to try running a virus scan on the Atari just for fun.

Good advice. I'm pretty sure a virus-checker for this virus was
on the simtel site, wherever that may be these days.

Although I always was satisfied with the program I'll surely check
whether there is any additional functionality available in that version.

Many thanks
Gerhard

referring to the atari laser printers,
I'm a laser printer and photo copier technician in Australia, and I'm just wondering, what engine are they based on, is it canon, xerox or what ? I cant find any technical info on these printers and there of great interest to me.

thanks..

Correct me if I am wrong, but the early DEC Alphas had some sort of
conversion software available to them while running under NT. Sounds
like it kind of does the same thing.

>
>Now, does anyone have any suggestions as to how I can make a backup of
>this disk?

It rather depends on how it is protected. I understand that some
software manufacturers actually burned a tiny hole in the floppy at a
given location and the program then checked that it was still there
(presumably by trying to record a byte or two at that position) before
it would run. With that type you would have to disassemble the program
to remove the protection, I guess. But if it allows one installation on
a hard disk, it's unlikely to be of that type. I can only assume that
when run for coping, some changes are written to the original disk so
that one cannot use it a second time. BTW, what do you mean that 'the
previous owner lost it...' - the hard disk? Or does it actually permit
one *floppy* copy to be made?

> Of course, the best thing would be to remove the copy
>protection altogether, so I wouldn't have to worry about these things
>and could install it on my harddisk without any problems whatsoever, but
>I'd have no idea where to begin, so I'll settle for a way to be able to

Many crackers do just this, though it has obvious commercial dangers of
unauthorised distribution. I'm not a programmer so can't help, sorry.

Well, try to run old games from System 6 times on emulators right now, or even on Spectre on your ST, and you'll see that even Mac software was not designed very well back in ye'old days (remember that we are talking 80's now!). Most will capture the system, assume a fixed resolution, or refuse to run at all.

Mac software nowadays is a different story...maybe. Although in my opinion Mac needs a pre-emptive multitasking system (which will show faults in the current software for sure....).

>tasks that don't involve colour.

I would think that for most tasks where you provide hard copy artwork
from laser or inkjet printers to a commercial offset printer or
photocopier, and the publication doesn't include colour work then
Atari generated stuff is perfect. B/W artwork or line art is easily
reproduced, just watch out that any fills etc are tweaked for
reproduction (ie made coarser).

Using Papyrus and NVDI output to the Laserjet 4 at 600dpi I have
always been impressed with the quality. However Calamus 1.09 output at
small point sizes (below 12 point) was always very poor at 300dpi and
not a lot better at 600dpi. It was quite acceptable at 1200dpi, but
that equated to 600dpi output from NVDI in my experience.

So have a look at the printer that you will output to. I've no real
experience of later versions of Calamus, so my comments may not be
valid. But unless I'm mistaken the basic Calamus CFN font format is
devoid of hinting, and that will effect quality, especially at small
point sizes on low res devices.

If work includes spot colour then again it can be done on an Atari.
But, if we get into colour photos and clip art life can get tricky.
I'm not saying certain programs on the Atari can't do it, more that
you will have to find a printer/bureau able to handle your artwork!

There used to be a handful of bureaus in the UK that could handle
Calamus files, but if you went the Calamus route you would be better
off using that PostScript module as that is what all bureaus accept
nowadays.

Best wishes
Mike Kerslake

>Documents and Folders items.

I've put the file in various places nested in folders etc. but neither
will work, apart from the START folder. On a similar note, is there
any way to close windows down onto appline?

Magxdesk just closes them into those little boxes. Otherwise I'm not
really that impressed with appline, I'm probably missing a good
feature of it though. I'd rather use the built in one, when you click
on the menu bar at top right of magxdesk.

Oh yeah, is there any way to stop windows opening up all the way to
the bottom of the screen? Is there a piece of software to keep SMU
and appline visible; just leaving the last few pixels at the bottom
free?

Thanks

Lyndon Amsdon

HDDriver does a good job. I used it to format a Mac Jaz cart. I believe
with TOS 1.04 the max size of a partition allowed is 32 meg. It is much
higher if you use Magic or Big DOS.

> marketing.

Hmm, I think the opposite - but not
"lousy" - just that Milan's marketing
was better than its R&D. In terms
of hardware it is nothing more than
what was already done several years
earlier with Medusa T40/60 then Hades.
Where Milan did really well was creating
an image and market awareness (never
mind if you could/can actually buy it).
People talked about it.

> In Germany which is the Milan *home-market* after all, it's quiet
difficult
> to get hold of a Milan, only a handfull of dealers sell them. Supporting
> the local dealers sounds very nice on paper, in practice it must be clear

> straight from the manufacturer? it should have been possible from day one
> to order a Milan and it's peripheals online from the Milan website and UPS
> delivering the goods within a week.

Apple Computer cut the throats of many retailers
by selling direct. It effectively said, "Stuff you"
to those who stood by during the hard years
continuing to sell Apple gear.

I suppose in the small Atari market, having a
dealer network allows some others to earn
their bread and butter, while also giving the
impression of being a bigger company.

> AFAIK the Milan can be bought in an assembled computer version or in a DIY
> kit package. Getting hold of that DIY kit is virtually impossible, there
> isn't one dealer in Germany able or willing to sell this.... why?

Profit margins in the computer retail
industry are now below 5%. You and I
wouldn't get out of bed for that money.
The value is in services, including the
building of machines.

> That kit
> is considerably cheaper and many people have got spare HD's, CD-R's, RAM
or
> can get them cheaper from a third party, that kit is 600DM cheaper opposed
> to the assembled version, 600DM could make *all* the difference...

Although there are some enthusiasts with
the appropriate technical ability, generally,
selling components to consumers is a liability.
Many people who don't know which end to
hold a screwdriver try to save money by doing
it themselves, then cause a whole lot of trouble
for the dealer which basically eats into that
pathetic <5% margin and turns the sale into a
subsidy.

> So let's hear it guys... who's interested in a DIY kit at the above quoted
> price? the kit contains all necessary cables, screws, processor, TOS,
> suitable drivers and graphic card.

This kit has been available from Atari Workshop
since dot, when it can actually get hold of stock.

> All that needs to be done is to plonk
> the whole lot in an ATX tower,

Then change the COM/LPT back-plate
and PSU for AT, change the power
switch to a mechanically-latching rather
than momentary/electronically-latched
ATX type, remove the plastic hood from
one DB9 connector because it's obstructed
by the silly placement of the motherboard
power connectors (after stretching it
near breaking point because it's too
short, even when using the *exact* same
Suntek cases advertised by Milan), stretch
all the other motherboard-to-back ribbon
cables because they're all too short, and
plug in a motherboard-to-PS/2 plate
for the mouse because it's a hybrid AT/ATX.

Hello all,

I found out that I needed this program in the Start folder of Magic before I could run Newsie 0.96 on my Hades. The program was included with my version of Magic. I guess this was built in, but Newsie will not run without it. Newsie 0.96 locked up the computer if I tried to access some parts of the program. Glad I got it solved.

My my, who's the touchy fellow today?

Atari's are just old shit to most people, something you throw in the dumpster or smash up for fun. Pull those keys off, rip out the ports with a pair of pliers, pry the case apart and slam a screwdriver through the heart of the CPU... yeah!

Just joking ofcourse, but it took you this long to realize that didn't it?

Regards,

Gerry.

<ironically>

The 68060 in the Hades works at 60 MHz, the CF works at 180 MHz... That's not
about 3 times faster, that's _exactly_ 3 times faster...

That's not a lie, that's a problem of semantics.

</ironically>

See ya,

DON'T FORMAT your PC SCSI drives - just partition them and the Atari
will see them. According to the acknowledged expert, the only ties
drives need formatting is when they have damaged sectors. Formatting
uses the embedded software of te drive and so is platform-independent.
It's only when you partition and install the file system that you need
Atari-specific programs. The best by far is HDDRIVER, though it's
commercial. It has special provisions for TOS 1.04.

>Does anyone know what the maximum partition size is for a 1040 st?????
>I am running TOS versio 1.04 if that helps!!!!

512 MB for TOS 1.04 per partition, and up to 14 partitions IIRC.

Date: Mon, 08 Jan 2001 11:16:27 +0000

Hi Bob,

>It's the market driven economy again. The punters mostly use PCs with
>one or other version of Windows and they want cheap and easy, boil in the
>bag products. So naturally, fiddly things like dip switches are out and
>software drivers are in. If I were a PC user I wouldn't want it any other
>way.
If I was a PC user, which I am not, and unless someone performs a lobotomy
on me, never will be, I still would not want stuff here that needs to be
configured by means of crappy software.
If you buy a software controlled printer or scanner, then you should ask
the personal written guarantee of Bill Gates, that he will not fiddle to
much with his wonderfull OS in the coming years. Chances on new compatible
drivers from the manufacturer are extremely small, they don't support "old
gear", that's common factory police...
Ever seen a monitor with only a on/off button? there's one in my office and
the W95 drivers supplied with that thing don't like W98 or WME... it's used
as a very stupid looking and expensive paperweight now. Philips never ever
bothered to update the drivers... the monitor is only three years old.

>Do I take it that the Epson 850 would be OK.
Yes, before I bought it I made sure it was compatible with our programs.
And as explained I also wanted a printer which lets the user configure it
without needing a Mac/PC in the neighbourhood...
NVDI supports it all the way, resolutions up to 1440*720 are possible. It
gives beautifull results with Imagecopy and the Epson driver of Calamus
supports it also, though only up to 720*720.
Apps that use custom printer drivers pose no problem either... even your
beloved DA's Layout has a suitable driver... the results weren't, much to
shout about but that's probably my fault.. I haven't got the faintest idea
how to operate that program...
So I you can locate one, buy it, steal it, borrow it.... whatever ;-)

Beware of the Epson 860 and 870 models, the numbering suggests that these
are the successors of the 850 model, they're *not*, and will not give you
the same functionality. The 850 was the top of the range model and it's
successor is the Epson 900, I haven't got a clue about it's compatibility
status and it's rather expensive.

>Can I send the heavy mob round your gaff it it doesn't deliver?
Those poor unfortunate bastards.... can you imagine the agony and pain that
will fall upon them once that some higly trained combat camels attack them?
these vicious animals show no mercy...

>All the best from drying out Wales
Not according to the ESA satellite, go get your umbrella...., there's a
super duper giant black thingy coming your way <grin> :-)

Cheers from Belgium
Dennis

Date: Sun, 07 Jan 2001 17:50:17 -0500

Hi Fred,

>That was my Milan FS here in the USA. I bought it from Woller Systeme in
>Germany via Credit Card. Took a longtime to ship but I did get it in one
>piece but with dead RAM, dislogded heat sink, wrong power supply.
That's an example of what Woller Systeme calls "service"...

>The math you discussed here is a bit off. I have not checked current
>conversion rates but here's the way it stood when I purchased the Milan in
>12-99. Milan was 1,500 DM which at the time was $.53 US Dollar to DM which
>works out to $795 US.
The value of the dollar has increased since then.. today 1.500DM works out
at roughly $710.

>Shipping I was charged was around $160 UPS Air. I did purchase other
>hardware and software which added to the weight. So anyone in the USA who
>wants a Milan can have one for roughly $1,000 US Dollars depending on
>currency rates at the time of transaction.
I've checked it again today.. first class air shipping (guaranteed delivery
in maximum 72Hrs) with Federal Express costs $93.50
So a Milan040, delivered at your doorpost, *now* would cost roughly $800...

What's bugging me is the fact that you've payed German value added tax on
the Milan... perhaps Mr. Woller would care to shed some light on this?
On goods sold for use outside the EEC countries that tax is not mandatory
and should be deducted at purchase. Woller should *NOT* have credited it.
I'm not sure but I think the German VAT is 15% or 17.5% ? anyway you can
work out the amount yourself.... I would say get in touch with Mr.Woller,
and try to recuperate a nice bonus...

Time for some new maths....
A standard Milan 040 with German added value tax deducted costs 1275 DM,
that's roughly $600, adding the shipping costs my little calculator shows
that $700 will do nicely. But I suppose that you'll have to pay something
like 8% state tax on the $600, so let's agree on $750 as grand total.

>Obviously everything is in German and if something is wrong (like my RAM,
>wrong power supply, no heat sink) or worse being dead you are on your own.
>I resolved all hardware errors on my own in about a week. One thing I did
>learn was that the Milan is extremly fussy about RAM.
Perhaps Mr.Woller could shed a light on this as well?
If you ask me he shipped you a Milan which has been thrown together without
going through the necessary 24Hr burn in test, to put it bluntly, your Milan

has never been tested at all before shipment... and if anyone tries telling
you different then the only option open is to blame the gremlins :-/

Cheers from Belgium

You should never indicate computer speed's in Megahertz unless you are using the same chip as a referance. If this were the case then some fool would think that a 486 DX2/66 is faster than a Hades060.

Hi David,

>> Cheesey programs? ever looked at what's available for the Mac?
>
>Dennis, did you say this?
Yes... I take it you disagree? I thought I was rather polite to that
brainwashed nitwit.

>Anyway, the Mac has best of class software for all major software
>categories and many quality programs for less common applications, at
>least here in the USA.
Really?
- As far as DTP goes, nothing will beat Calamus
- Show me one decent Mac wordprocessor and I'll give you my kingdom...
- How about some software that can burn a *real* audio CD?
- etc...

Oh, and I can run these three applications at once, while playing a game of
mastermind and posting this... how's that for starters?
Once an Apple is capable of doing this, I might change my mind about the
"cheesey" bit, but will certainly not forget that it took them eight years
to catch up.

Cheers from Belgium

>this new machine. Shame the only time I could use it is when I'm asleep
>and experiencing REM!
Well, let's give Medusa the benefit of doubt.
That German STC magazine isn't the most reliable source and since there
hasn't been an official statement yet...
I think the final specifications of the "Pegasus" will undergo some heavy
changes...
Remember the MilanII specifications? I would be perfectly happy if they
announce something along similar lines. At least it would be feasable, and
who knows... supposing they can come to some kind of agreement we might even
see a Pegasus with MilanII specifications that runs on a PPC driven by the
Tempest engine... now that would something to get exited about ;-)

Cheers from Belgium

Diamond Edge v2.04 and Diamond Back v3.60 are the latest (last)
versions I know of. Both offered a brand new windowed interface and
Edge offered a couple of utilities - a Disk Editor and a File Compare
program.

The Disk Editor could cope with up to 32k sectors (as compared to the
512byte sectors that TOS 1.0 offered to give 16Mb max partitions.

Does this mean that Edge can handle 1Gb partitions too?

I think they are now built-in. I've disabled it and after an initial
question mark I haven't had a problem without it.

I think the original questioner wasn't using v6, so the answer was
appropriate.

Hiya

Yep Newsie is the best I've come across: email, newsgroups, ftp, and
text browsing in 1 application, good idea.

But on the pc Outlook Express and Outlook both I have found wanting and
are a security risk. I mean when does read me run!

I use Turnpike which I have found to be bomb proof, I don't think any
virus can spawn using it's address book. I think they wrote it so that
that they didn't know how to access it through a back door.

Well i paid ï¿½30 GBP for it, but Demon customers can use it free (yep
figures they brought it out after I bought it). But I think it's worth
every penny. Once set up it is faster for mail collection than oe or
outlook 2k!

Just my penneth worth:)

If anyone wants an Atari Web Site hosted for them for free then contact my brother.

atarihosting@recycledsteel.co.uk

All you need is a Domain Name (he can supply them for £5 or something or it can be sub-hosted), he will give you pretty much unlimited space on a NT (ASP) server (or maybe Linux you will have to ask him). Only thing is NO WAREZ, PORN, or similar stuff.

As for anyone with a .de name I do not know how/if that will work but ask him if you are interested.

Mark.

I'm not sure about GFA, but you can still buy copies of
Hisoft Basic which is more than cabable of creating
GEM programs. The guy you need to talk to is Matthew Bacon.
He can supply you with Hisoft Basic and he is also the author of
Enchant, a set of routines to make GEM programming easier.

Take a look at http://www.cadenza-software.co.uk

Hope this helps.

Hi Gerhard,

>> It's main use is to scan slides and negative film... I have bought one
>> for the Epson scanner a while ago and I'm very pleased with the
>results.
>
>What model do you have ? I have a 8000 and I would like to be able
>to scan slides too but I don't think there is a module available for
>that model.
I have the 1200 model, the module costs 189DM including a useless CD which you can use as a frisbee... IIRC than there was a module available for the 8000, but it costed a small fortune... it'll be lots cheaper to buy the 1200 with slide-module.

Epson also made the GT-7000 which is basically a revamped 1200. That 7000 model was also sold with a slide-module. I saw it for sale for DM299 a few weeks ago at the German based Computer Profis shop, so if you hurry up and are lucky, they may still have some left....
http://www.de.insight.com (great for other hardware to)

Cheers from Belgium
Dennis

Hi Bruno,

>> Really ? GTLOOK II was quite expensive when I bought it ages ago
>> (7 years ?). Do you know what the most recent version is and where
>> to get it ?
>
>and the GDPS compatible Epson SCSI driver too ?
AFAIK only from some selected Maus BBS's... I'll translate the complete
program and docs.. when the package is ready look for an announcement here
stating it's available from Derryks website (see sig) in the meanwhile take
a look in your mailbox... :-)

The driver works with all Atari's and clones except for the Falcon, I've no
idea why it doesn't like a Falcon. Since it's a GDPS driver working with it
is much more comfy then with GTLOOK, you can scan straight into Photoline,
papillon, OCR, Calamus... etc

Cheers from Belgium

Hi Lyndon,

>Well SMU was running fine when the set file was in the START folder,
>but I know this isn't the best place for it. I set in magx.inf
>#_ENV HOME=C:\USER which is what it says in the docs and then created
>C:\USER and C:\USER\DEFUALTS. I put the set file in both USER folder
>and DEFAULTS but it doesn't pick it up from either of those locations.
Give me the benefit of the doubt please.... :-/
Rename the folder USER to HOME, and don't forget to cahnge the ENV line in
magx.inf accordingly, I've come across other programs that only want to dump
their files in the HOME folder, and for some reason don't like USER...
BTW: whe seem to have different docs...

<SNIP>
Copy Start Me Up! to your MagiC APPS/START folder.
Alternatively Start Me Up! can be launched manually from the desktop
etc. The configuration file START.SET sets all the options and is
searched for in the $HOME/DEFAULTS and $HOME directories.

$HOME is an environmental variable and if you don't know what this is
forget we mentioned it unless you run into problems!
<SNAP>

The above quote comes from the Start Me Up hyp file....

Cheers from Belgium

I like Explorer/OE, and security probably isn't any better on anything for the Atari, but because almost everyone uses Explorer/OE, that combo is going to be targeted.

Not to be picky, but how much faster could it possibly be? Outlook express ain't no slouch where it comes to checking email, at least not on my network/setup.

Hi Shiuming,

>>it should have been possible from day one to order a Milan and it's
>>peripheals online from the Milan website and UPS delivering the goods
>>within a week.
>
>Apple Computer cut the throats of many retailers by selling direct. It
>effectively said, "Stuff you" to those who stood by during the hard years
>continuing to sell Apple gear.
I wasn't comparing Milan with Apple...
Like it or not but it's about time we face it.... there are hardly any
Atari dealers left, and on top of this some can't be trusted !!
It seems to me that if the traditional channels are drying up, it's about
time to try a new approach, the customers still have a choice, personally
I would buy from a reputed dealer, but I can imagine living somewhere at
the other side of the world where this just isn't possible. I can also
imagine people who put more trust in buying their gear straight from the
manufacturer.

>I suppose in the small Atari market, having a dealer network allows some
>others to earn their bread and butter, while also giving the impression
>of being a bigger company.
The problem is that there isn't a dealer network anymore, how many dealers
are left in the UK... I wouldn't call this a network, one could call it a
network with big holes but I suppose this would be regarded as being
sarcastic. :-/

>Profit margins in the computer retail industry are now below 5%. You and
>I wouldn't get out of bed for that money. The value is in services,
>including the building of machines.
5% ? Why is there such a big difference in price between a British "build"
Milan and a German one... what service? the docs and software are still in
German, and the assembly of the computer is reflected in the price. If the
computer is assembled correctly, service should be minimal.

>This kit has been available from Atari Workshop since dot, when it can
>actually get hold of stock.
Great.... but isn't it a pity hardly anyone knows this. The website hasn't
been updated since dot either...
In the good old days when there were printed magazines we could look at the
adds for more information, price and availability. Most of us depend on the
internet now for info, if a firm/dealer doesn't bother updating his pages
regularly we get the impression that the products we're looking for are not

sold/available by that dealer.

>> All that needs to be done is to plonk

>all the other motherboard-to-back ribbon cables because they're all too
>short, and plug in a motherboard-to-PS/2 plate for the mouse because it's
>a hybrid AT/ATX.
Perhaps....
But certainly *not* when installing the board in a Suntek 7896A or 6896A
model tower... costing a bit more ,but of a better overall quality are the
tower models from FUM DA, these will accept the Milan motherboards without
the need for any modifications, (you can order a mixed tower from them,
meaning ATX case with an AT PSU...)
see...http://www.fumda.de

>>That kit is considerably cheaper and many people have got spare HD's,

>Although there are some enthusiasts with the appropriate technical
>ability, generally, selling components to consumers is a liability.
>Many people who don't know which end to hold a screwdriver try to save
>money by doing it themselves, then cause a whole lot of trouble
>for the dealer which basically eats into that pathetic 5% margin and
>turns the sale into a subsidy.
Right I agree... someone who never seen the inside of a computer should
stay away from the kit... however there are enough people out there that
know what they are doing, and even if they don't then there's always help
around the corner in the form of a club, friends with technical abilities
or if worse come to worse... here.

I've no idea about how large/small the typical profitmargin is, but I have
strong doubts about that 5%. I've yet got to see the first product which
only cost a fraction more then in Germany... surely German dealers need to
earn their bread and butter as well? taking extra shipping costs and even
the fluctuating exchange rates in account there's still a very wide gap
between the German retail price and prices in other countries... and those
German dealers give service also...

Now that I've climbed on my high horse....
I'm fedup with hearing the very lame excuses that hardware/software costs
more abroad because of the service given. English docs and translations are
usally reflected in the price, which is normal, but what isn't normal is that

for example MagiC 6.0 users are waiting nearly two years for version 6.10 to become available in English, not to mention all the CAB 2.7 users waiting for an English version 2.8 to appear.
Where's the service there? I find it only normal that someone who bought a program is given the oppurtunity to upgrade when the next version comes along... and I'm not even going to mention Texel 1.6 users. People who would like the latest version have no other option then to order it at full price from ASH or a dealer on the continent... so much for service, I would think again before ordering anything from such a dealer/distributor/whatever.

Cheers from belgium
Dennis

>a decade ago when my main machine was a ST there were several of us that
>swapped good civilization system clock times. Start at the right time
>and get a good continent with no one else on it :)
Those were the days... :-)
I remember playing some adventures which were *very* time critical, if you
weren't on the right spot at the right time, then there was simply no way
to finish the game.
Maupiti Island, Colonels Bequest and Cruise for a corps spring to mind.

BTW: the best way to win civilization is simply too choose the most
difficult game level, select "the Romans" and after three moves destroy
the "Greeks" which puts you in control of whole Europe for at least 1000
years. In the mean time build castles and go hunting through the woods for
treasure and wisdom... when the Germans turn up close a pact and destroy
them in the year 500, it never fails, you always end the game succesfully
in time, after a while it even becomes boring :-)

Cheers from Belgium

No legal documents have been seen by the public (and neither of their accelerators either:) Actually I did see a "Hawk 030 Prototype:) From the horses mouth, the source code was found while pilfering around the Atari warehouse during closeout......Finders keepers?
I think there are still paranoid (or consciousness?) people around (aka but it was commercial software just 15 years ago...). If, for whatever reason, a group or person wanted to "modify" TOS 4.04 and sell the ROMs (in the US), they likely would see no recourse from Hasbro, Wizztronics, or Bill Clinton. Why one would purchase the ROM is a different matter (unless it provides 68060 or PPC support:).
Milan might bitch, but they did their deal overseas, AFAIK, not with the US affiliate. That works for them.
The Falcon is one bad little machine. Wizztronics has made some decent hardware as well. It's god awfully slow in stock form, but has features that abound. Can't forget all those cool demos as well;) It really is a love affair, and will cost you about the same in the long run:)

Mikey

Word to the wise......
(Not being involved with the ST line may have left you a little in the dark concerning hardware modifications. There are many for the Falcon. Most are decent products, but almost all depend on some sort of "hack" to install. Be very very careful and think through what you want to do).

Not sure if the boot code for TOS 1.00 was the same as for TOS 4.0x -
however, you need a TOS image that is compatible with the boot code (which
is in sector 0 of the disk), *and* that is meant to run in RAM - you can't
dump a ROM TOS and expect it to run in RAM.

I found a CD some time ago in a boot sale that simply said ST Software, it turned out to have all the PP, FOF and another (I forget) on it along with emulators.

I do not think it was commercial (it was a CD-R and was scribbled on in pen).

I am also sure that a number of people want to make a CD with everything on it but never get around to doing it.

Mark.

Actually, I think the Milan hardware *was* a step further than the Hades: it has a PCI bus that *works* according to the specs even when using multiple PCI slots, it has a complete ISA BUS, a full parallel port, DMA-capable IDE, and is a much more streamlined design, focused not so much on absolute compatibility (which the hades also lacks, eg. on the SCSI bus), but on a machine that has the necessary stuff on board to make it a good compromise between features that everyone needs and an affordable price.

Agreed, there were bugs in the beginning, in both hardware and software, but the hades had these, too - ask a long-time hades owner how many hardware upgrades he went through.

>cables because they're all too short, and
>plug in a motherboard-to-PS/2 plate
>for the mouse because it's a hybrid AT/ATX.

Hybrid?

The Milan 1 is a pure AT design, nothing ATX-like - when we started designing it, ATX cases were quite expensive, and offered no advantages besides the minor inconveniences with the connectors - however, *I* would not have been willing to shell out an extra 100DM to avoid these.

Nowadays, any new design would of course be ATX, and use DIMMs instead of SIMMs - that's exactly what the Milan 2 prototype looks like ;-)

(and no, this does not mean there will be a Milan 2 - I say "looks" just because it exists, there are no plans to revive that design and take it to production).

I've heard over and over recently that Mac's can't multitask. Could someone explain this to me? My iMac seems to be able to without any problems. It may be co-operative (which I've heard Mac's have been able to do for many years), but it's still multitasking, isn't it? I mean, for all intents and purposes, I can see very little difference, at least from a user's perspective, between co-operative and pre-emptive. For example, using Geneva on my Falcon, the difference between co-operative mode (normal Geneva setup) and pre-emptive mode (running Geneva with Mint) is almost imperceptible, except for the slightly lower stability of the Mint setup, a slight speed increase, and the ability to use long filenames. I'm able to run a number of programs together on my Mac, and they are all still plugging away in the background. If this isn't multitasking, am I just imagining they're running? When I'm running Geneva in it's normal setup, am I not multitasking?

>BTW: what's the status on AGP 2.0 and PCI 2.0?

Not sure about AGP 2.0 (IIRC, it exists). PCI 2.0 is outdated (even the
Milan 1 has PCI 2.1), the current PCI spec is 2.2

No, it stays wrong. "Faster" is not correlated with clock speed.

Even with thew same CPU, MHz is meaningless - a Milan with a 25MHz 68040
will have a different performance than a Hades with the same CPU and clock,
due to different memory interfaces (the Hades should be a bit faster).

611. Atari version of Westfront PC planned

Newsgroup: comp.sys.atari.st
Date: 2001-01-10 17:45:08 UTC
From: pap3@dana.ucc.nau.edu
Message-ID: <93i734lgh4@usenet.nau.edu>
Source record: 51990

Subj: <version> version of Westfront PC planned :)

Text:

As some of you may know, I have been working on porting my
game, Westfront PC: The Trials of Guilder, to Atari 400/800 format, as
well as others. Currently, my game is only available for the following
platform:

IBM PC/Windows 9x/Me/NT/2000/Whistler

I wish to port Westfront PC: The Trials of Guilder to multiple
formats, including the Apple II/IIe, Atari 400/800, Spectrum, DEC
Rainbow, TRS-80, CP/M, Unix/Linux, Macintosh, Commodore Amiga, as well as
(it was originally coded on) the Commodore 64/128.

Users of the Atari 520 ST and 1040 ST may be interested in a port to their
16-bit GEM system as well. Please contact me if interested. All will be
based on the old Commodore 64 version.

For more information, please visit my website at:

http://www.geocities.com/dunric/westfront.html

Thanks! :)

Regards,

Paul Panks (a/k/a "Dunric")

612. CAB.OVL 1.4102

Newsgroup: comp.sys.atari.st
Date: 2001-01-10 18:18:36 UTC
From: atlan@foni.net
Message-ID: <93i91s$mi9$1@olaf.komtel.net>
Source record: 51798

Hi,

I love Dan's CAB.OVL, because it has a very good cookie support. But after being offline for some months, it's not possible to start the 'download' or 'autosurf' modules of CAB with the actual CAB.OVL (any 1.4x version).
I use STinG 1.26 with MagiC 6 on my Falcon030, the only accessories I use are ST-Guide and COPS.
Download and autosurf work fine with the CAB.OVL from Olivier Booklage or when using IConnect and the original CAB.OVL from ASH.
But I want:

1. to use STinG

and

2. to have a very good cookie support and further development like with Dan's OVL. :-)

Any help would be appreciated.

Thanks in advance.

Ciao, Eick

The Original David schrieb:

> from memory they use MFM hard drives,

AFAIK the Megafile 30 used RLL hard drives, which uses the same bus (definitly neither IDE nor SCSI) as MFM, but higher formatted. The bus is called SH-503 or something like that...

IMHO you can't use an IDE drive in the Megafile 30.

AFAIR the original Megafile 20 used a SCSI drive (because of that, many Mac users bought one, stripped the ACSI-to-SCSI-Converter off, and connected it to their Macs ;-).

Interesting problem. I wonder if the internal pressure exerted on the cabin hatch would be greater than the outside force on it if opened during mid-orbit? I assume he means the shuttle is still accelerating, and in somewhat of an atmosphere. Even if the door only opened for a split second, it would be far easier to fit an ST through the opening than a full tower PC.

Of course a decent Windows 2000 machine could easily, and accidentally, blow the explosive bolts on the hatch, killing all those inside, which makes the computations mute.

Remember, the Lunar Rover had a 68060 inside:)

From my experience you just cannot copy the image to another disk and boot it. I tried that and it did not work. The only way to make a copy of the disk image file and have it boot is to do it is to boot up the TOS disk, then do a disk copy while under this TOS. I can send you a copy if so wish. Just give email me your address.

It probably is a conflict between Sting 1.26 and the latest Cab OVL file.
This same thing happened some time ago with STiK2 and a particular version
of the Cab.ovl file. The download module could not be activated unless I
used a previous version of the ovl file. Dan later fixed the problem. 1.402
works fine for me when using STiK2. Try using it instead of STing and see
if that fixes your problem.

If you open it up more than likely
you'll find an EIDE device attached
to a 1394 host adaptor. Pull that off
and connect it directly to your Falcon.

The incompabilities, speed & the difficulties of getting this chip to
run 68k code have been exaggerated somewhat in this sterling forum.

This chip is used by the embedded industry to run legacy code if there
where major rewrites of software to do, the developers would have
moved their code to other platforms long ago

I think you'll find that most Megafiles used the now obsolete RLL
encoding drives. The exception is the Megafile 44, which used a SCSI
SyQuest AFAIK. There was no IDE at the time, IIRC.

The Epson 850 was the greatest of the ESC P2 printers. Of current
models, only the 740 is still ESC P2. Modern Epson printers (including
the 900) are ESC Raster and operate somewhat differently, although
there have been posts on this group stating that NVDI 5 drives them
correctly.

Funny... I know know that it is a EIDE HDD inside. Since I borrowed the drive
from a friend (mac user), he does want it back in _one_ piece, and I still
want him as a friend.

I borrowed it for a few days to transfer some data from it (mp3 files mostly
) but I guess there is no choice now but to use good old serial port
between his mac & falc....
oh, just thinking of the painful slow speed is killing me.... even @ 240Kbps

Not as easy as you think... the Maxtor 1394 is a firewire device. There is no firewire port on my falcon. Anyway I think investing in a firewire to SCSI convertor is not a solution as I did afterall borrowed the drive and only be using it a couple of days for some file transfer.

Thanks anyway.

in article 93j3os$28d$1@mailint03.im.hou.compaq.com, william wong at wongck@letterbox.com wrote on 1/10/01 5:54 PM:

> I wonder if the Tempest is compatible with this new monster.
> @733 MHz it will sure blow away any Atari compatible out there.

Unfortunately, the processor Tempest is going to use is different than the normal PPC. It combines a 603e core with additional circuits for memory handling, PCI, etc. This means that in order to use newer G3/G4 CPU's, Tempest would have to be redesigned with these extra circuits added outside the processor. In other words, it would be extremely expensive, much more than the average Atari consumer would probably be willing to pay.

634. MagicOS.de and Place2be.de

Newsgroup: comp.sys.atari.st
Date: 2001-01-11 02:18:27 UTC
From: Michael and Nicole Freeman <nameerf@flash.net>
Message-ID: <B682662E.8A63%nameerf@flash.net>
Source record: 51820

Is it just my imagination, or have MagicOS.de and Place2Be disappeared? I know there was some discussion here about Place2Be, but that was at least a week or two ago, I think. And now MagicOS shows and "Error 302" page with a picture of some seagulls and something in German. Any idea if these pages are coming back? They were two of my favorite Atari news/resource sites! Thanks!

Right. IDE made its debut on the Atari platform in the Falcon.

True, they have at least been able to put a working sale item into the
homes of a number of Atari users with the T40/T60, albeit at scary price...

> Remember the MilanII specifications? I would be perfectly happy if they

It would be nice. I'm not going to hold my breath or get too excited until
they ACTUALLY SHOW A WORKING ONE to Joe Public. Until then I remain hugely
sceptical about the entire project. I liken it to a PC shop saying they can
sell a 1000MHz Athlon, but that you cannot test the machine, or even see it,
until you have forked out money...rude!

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Actually if you look at it. As far as I can think of Milan is
about the only product in our market you can't get directly from the
manufacturer. Mario sells his products directly as well as through
distributors. Hades come directly or through dealers (at least I think
there are dealers that will still order you one). Centurbo again was
available directly or through distributors. I wonder how many years back
you have to go before you can find another major atari hardware project
that was only available from distributors?

But it's not just our market that is that way. Apple went this
way years ago and IBM and other major manufacturers have done it for years
as well. Heck you could even buy an atari machine directly from Atari US
when they were operation. It wasn't the cheapest route, but you could do
it.

The way most people get around the dealer problem is they set a
price their product can sell for bare minimum. If you get caught not
selling at that price level or higher they cut you off the dealer list.
So say they have a product they want to sell to distributors for $400,
they give it a 25% mark up and make the enforced minimum retail $499. (hey
it's almost 25% and you know it 99 is much cheaper than $100 ;). Finally

they sell on their web site for $499 or $500 for the product. Dealer still gets a discounted price and can make a few bucks, and people with no local dealer have an option to buy directly.

>>I wouldn't get out of bed for that money. The value is in services,

>Milan and a German one... what service? the docs and software are still in
>German, and the assembly of the computer is reflected in the price. If the
>computer is assembled correctly, service should be minimal.

Unless the UK is different from the US, I have to agree with the 5%. If you are in any sort of competitive market you can't expect much more, unless you can start to order in large quantities, where you get a bigger discount from the manufacturer. The work around for the 5% comes in value added deals. Say you are building machines, they need a hard drive for them. You can find 4 gig IDE for $20 on closeout or 30 gig for $99. Which do you buy? Which do you charge for? Don't get me wrong it's not necessarily a rip off for most people that would never have access to a cheaper drive and no real base of experience for putting a machine together. But it does enable a distributor to take components they are making 5% on and leverage it with items they are making %50 markup on.

The only things I can think of that have real profit margins on them are new software. In the PC world I've seen this run %50 - %100 markup (how do you think they can afford to mark the last ones down so cheap) and certain boutique items. HP printers used to have a very lucrative markup, but then you had to qualify to sell them.

Most of the stores are that way. I was quite happy today when trolling around to come across Anodynes web page which had been updated last month :) Sad in a way, but it was the first commercial web site for the atari I saw today that had been updated in the last 6 months.

I guess I also saw that Draconis was updated, but I saw that back before germany went offline ;)

>Now that I've climbed on my high horse....
>I'm fedup with hearing the very lame excuses that hardware/software costs

>an English version 2.8 to appear.

' Well maybe you should set up a commercial account with PayPal and
become an international online Atari dealer :) To be honest part of the
problems with the dealers is the distributor market fell apart years ago.
It makes it less enticing to carry a wide range of atari software titles
when you have to deal with 3 dozen companies to get 3 dozen products.

I still enjoy this style of game, but none of them have the
staying power for me that Civilization did. I probably spent weeks of my
life playing that game ;) I find that whenever I play with a new one I
have a small amount of time before all disimilarities between it and Civ
fade away and I get bored with it.

In away it's kind of like Seven Cities of Gold, a really great 8
bit game. Wasted alot of time on that. But all the pseudo updates and
clones haven't interested me. But if you were to come over and hook an 8
bit up and give me the chance I'm up for a couple of wasted evenings
playing 7 cities of gold again ;)

Funny, but what is it about you that makes me think you are a loser? Or that you probably fall far short of the category some call computer literacy? If I delve into the posting headers far enough, will I find out that you use AOL?

You must know next to nothing about computers, or you'd be so much slower to insult even one that you consider undesirable. Either that, or you are a Grade A asshole.

I use a 20GB IDE HD in my Falcon. Of course without bigdos and with only TOS partitions you could use only 9GB (partitions C to P with 1GB each) without problems. BTW, without HDDRIVER version 7.6 or higher you can only use up to 8GB.

I got a version now that I could unzip. The distributor (Gerd Hï¿½ller,
gerd_hoeller@t-online.de) made it available to me. The whole point
is that Interface is NOT FREEWARE (unauthorized copying is forbidden)
and although they charge no money for it you can only get it legally
by requesting the password (or password free copy) from the above
mentioned address. That way they know everybody who wants to have the
program. What they want to do with this information I can only imagine
but since they give the program for free I think it's only fair to
give them that information in return.

651. Problems With STinG

Newsgroup: comp.sys.atari.st
Date: 2001-01-11 10:00:00 UTC
From: Mark <mark@recycledsteel.co.uk>
Message-ID: <979207287.4222.0.nnrp-14.9e98a620@news.demon.co.uk>
Source record: 51838

I have installed STinG (1.26 I think), I have set-up the script file and all seems OK, it dials, connects I get an IP address and everything.

When I try and PING something I get nothing, when I try resolving an address it says it can't. Anyone know what is going wrong?

The only part I am not sure about if the 'Formal Domain Name' or whatever it is, should this be the DNS server name? This should not make a difference to pinging actual IP address but it still does not work (must admit I was guessing the address).

The 'obtain an address' is selected but does not help.

Any ideas?

Mark.

Here's a few of my recollections about "Disc TOS"

I recieved a copy as a thank-you from someone about ten years ago who was happy about a utility I'd written for their ST. (I hadn't seen or used disc-loaded 1.0 before that - I knew about it, but was only familiar with the 1.0 and 1.2 ROM versions up to that point)

The version I got was on a simple single-sided ST disc, and was copyable from the desktop.

It used a boot-loader routine that was contained in the boot sector of the floppy disc, and would only work if it was loaded at boot time. The TOS.IMG file that was on that disc was 206-odd thousand bytes long. (It needed to be shrunk before it would fit into the 192k [196608 bytes] allocated for it in the ROM memory map of the 1986 1040ST)

It appeared to work quite well on my Mega 4, completely replacing the builtin TOS 1.2, until the next reboot/restart. It seems to work on other STs, but I cannot comment on how well it would work on STes or MegaSTEs. It will NOT work on my TT (I only tried to see if it would load/work as a matter of curiousity)

When the application/utility software queried the TOS version, it was 1.0 (same as the 1.0 ROMs) - and had a date of something like May/June 1985, and, I think, was an American version with the wierd month/day/year dates displayed in the desktop windows, instead of the saner day/month/year used in the rest of the world.

The only other giveaways software-wise were the GEMDOS version 0.13 instead of 0.19 found in both the 1.0 and 1.2 ROMs, and GEM version 1.0 instead of (1.10? 1.20?) in the 1.0 ROM version.

Alas, I no longer seem to recall where it is - or if I still have it

Source record: 51840

The trouble is the Atari (TOS) community is spread over many countries and probably only reaches 4 figures, there is no money here so no one wants to develop. I work with PCs every day, I hate them, the only computers I have at home are Atari's and I do not want to see a PC when I go home. I think using a 80x86 chip would destroy my escape from the PC world.

Coldfire is really for embedded applications not like the PPC which is designed for desktop stuff (I know that is not good argument), I am also sure that the G3s and G4s have good 68K emulation software and can do it quicker than a Coldfire, the G3 is also going to be braking the 1Ghz line very soon (not the G4 for some reason).

I would rather use a MAC or maybe one of the below could be adapted;

http://www.bvmltd.co.uk/vmeprods.html#VMEbus

http://www.gcrellon.co.uk/micro/SysSolutions/frames2.html

Most of these have all that is needed including Flash memory, SCSI, serial, parallel, etc. only problem is price - I have requested some information but I do not think they are cheap.

There are also other clones out there not to mention any names.

Elliot...

The problem lies in the way the x86 CPUs work, everyone blames intel and thier idea that a 16 bit processor should be backward 8 bit compatable and so on to the modern 32 bit ones. Something Motorola decided against thankfully.

How I agree,and it's a pleasure working with a modern desktop. AFAIK there's been no development on Thing for some time now, so if anyone needs support for modern features...

The one thing I'd like though is some way to save files to the desktop, as if it were another drive. That's about the only Windows feature that's a useful one to add IMHO.

That's done it, although it doesn't seem logical! I can also see that my SMU
popup reverses the order of the Documents and Folders to that in my .set
file!

Cheers! :-)

660. [HELP] Installation instructions for PC-Speed

Newsgroup: comp.sys.atari.st
Date: 2001-01-11 11:12:25 UTC
From: french-lines@usa.net
Message-ID: <93k4el$pb8$1@nnrp1.deja.com>
Source record: 51844

Hi,

Many years ago, I acquired a "PC-Speed" hardware device from SACK Electronic GmbH, which would plug over the 68000 CPU of an ATARI STe, and give access to DOS based programs.

In fact, I never went on to installing the device, (probably because I didn't want to void the ATARI's warranty), and the box laid in the back of a drawer for many years. Finally, I have decided to give it a go. I have all that is necessary (the board, the software) except the installation leaflet which presumably explains the hardware installation procedure (in particular, which way round you should install the board). My board is specifically for STe's (square type CPU).

So, if anyone has experience with this, and has kept the installation leaflet, I would be very grateful if you could send a copy (either scanned leaflet, or just the instructions).

Thanks in advance,

Patrick

It seems that the version of Interface that was originally available for
download from http://www.hadley.de/hauptseite.htm has been superceded by
V2.33. The unlocking code for the version previously there does not work with
this one. There's what appears to be an email address on the page of
passwort@hadley.de, to which address I have applied for a code.

I think what he is talking about is with the LocalTalk adaptors.
These are litle boxes on the mac that plug into this port and then you run
phone line between the boxes. Similar in principal to running a Coax
network as far as wiring goes. Termintaors on the ends and all in one
chain etc. I have some of these boxes but have never got them
experimented with. Main reason being how this port shares the fast serial
port so it's an either or proposition. I'm sure I'll get around to it
some day when there are 5 other people left using these boxes ;)

I have gemulator on a ZIP disc set as drive Z on my PC.
I set gemulator to boot from Z.
It still seems to want ACC and I think AUTO folder the PC partition C.
I thought it only needed NEWDESK.INF on C.

Could anyone give me the correct place for ACCs and AUTO inorder to
boot from Z.
(I much prefer to ATARI stuff as separate as possible from Window
sphagetti)

Thanks
Norm

I guess you really do not want to pay for these boards as a hobby machine.
Apart from that, it should be possible to run TOS on one of these boards
with similar efforts as were needed for Milan or Hades.

The link was broken at the time I had to go to Rodolphe for them.
Perhaps it is working now. Seems there was also an issue that the kernal
on the centek site was outdated and no longer working right, and the
linux.os people needed sources which were not on centek.

Well, the official website for the project is http://www.xtos.de/
(German only), and on it they claim that the developers would never
publish any rumours, assumptions or theories. Just facts and definite
decisions.

Given that, and assuming Fredi's one of the developers (hehe), the
interview is either a complete fake, or what he really believes in ...

Ciao

As other already explained, this is just because your version is a beta.

> Do you have contact with the author still?.

In the german MausNet newsgroup maus.computer.atari.software, this was
discussed as well. Reiner Rosin is currently moving, so he can't publish
a fixed version without expiry date now. But he promised to do so ASAP.

For those of you who understand german:

what are you doing with 45g hd on falcon ? Does it boot fast or it takes
5 min to boot ?
From my experience my friend has 30gb hd on athlon 862mhz and because it
has so many tracks and sectors to read at the boot, it takes longer than
smaller hd (FAT table)
So I cannot imagine booting 45g (IDE) on a 16mhz Falcon, must be damn slow
!

I don't think STing has something to do with the problem Eick is facing
at. I tried the "autosurf" with Sting (latest version) and the latest
public release of Dan's ovl. I autodownloaded the whole freeMiNT portal
site without any problem. The whole thing came in smoothly.
I don't use MagiC however but freeMiNT/N_AES but this won't make any
differents I suppose.

The size of the disk doesn't affect booting (or speed in general) at all,
unless you run a filesystem-check of some sort at every boot.

Source record: 51867

Hi all,

Following additions have been made to Atari Icon Library:

Archive 85 - 15 document icons by Scrow
Archive 86 - 22 QNX icons by Scrow
Archive 87 - 103 Glyph icons by Scrow (all are 16x16 in 256
colours)
Archive 88 - Icon set "Junje" by Scrow. 98 in 32x32 size, and 98 in
16x16 size
Archive 89 - OpenStep icons by Scrow, 24 in 48x48 size and 26 in
32x32 size
Archive 90 - 28 halloween icons by IconStreet
Archive 91 - Icon set with 49 OSx icons by IconStreet
Archive 92 - Icon set "SoftD" with 78 icons in 32x32 and 64 in
16x16, all by Scrow
Archive 93 - Icon set with 50 icons, house of @REGis from
IconStreet
Archive 94 - Icon set "preemo" by Scrow. 66 icons in 32x32 size and
66 in 16x16

Have fun with these new sets, and don&#65533;t hesitate to write back and
suggest new additions or perhaps send in some new icons to add :) This
time all icons are converted by me

>

Hmm... whats meant by "Rename the folder USER to HOME"? I dont think the
folder (the path, that is) that this environment points to has anything to
do with the problem. What I think is the problem, is the name of the
environment variable itself, which should be HOME, and not USER. So, I
would think that perhaps help to just rename USER to HOME. Ofcourse, the
path pointed to by HOME has to exist :-)

>I use Turnpike which I have found to be bomb proof, I don't think any
>virus can spawn using it's address book. I think they wrote it so that
>that they didn't know how to access it through a back door.

It uses it's own address book, rather than the Windows address book, and
as Turnpikes address book is only accessible to Turnpike, no viruses
have yet been able to access it. On top of that, Turnpike won't run
scripts when viewing HTML news/mail messages, so there's little chance
of getting a virus that way without deliberately infecting yourself.

>Well i paid ï¿½30 GBP for it, but Demon customers can use it free (yep
>figures they brought it out after I bought it). But I think it's worth
>every penny.

When I bought mine 4 months ago it was ï¿½15.00 + VAT, ï¿½17.63 inc. and
definitely worth every penny.

Hi Galen!

Multi-drop basically means (in this context) that the same set of wires can run between multiple pieces of equipment - I was thinking of multiple TTs or Mega STEs. I get the impression that Apple's LocalTalk worked by virtue of RS422 multi-drop.

G> IIRC however, there are two types of Apple cables that
> can plug into that port, and I'm not 100% sure I used
> the serial one.

I'm guessing they're both serial, but they may be wired differently for LocalTalk and regular RS422.

G> Yep. SLIP is generally recommended, though I don't
> know why.

I understand it's a more simple protocol than PPP, I imagine it's a lot more simple than all of AppleTalk.

Regards,
- Andy.

MK> 800 X 608 - 16 colours. Doing text in 256 or TC is
> like wading in treacle! Visible diagonal is a touch
> under 13.5".

That's about 96 DPI. I may have asked you this already, but does text look smaller on screen than on paper? (Note: I'll be quite happy to put up with that if someone buys me a 15" monitor and a Falcon to go with it ;o) I can easily believe that text is significantly slower in deep colour.

MK> I've just had a thought, later versions of Pressworks

Hopefully not HTML. Don't get me wrong, I /like/ HTML, but I've yet to find a program that automatically generates sane HTML from another format.

> boxes. Similar in principal to running a Coax network
> as far as wiring goes. Termintaors on the ends and all
> in one chain etc.

Those are indeed what I had in mind - well, sort of. The ones we used on Macintosh didn't use phone wire, but some sort of cable with a mini-DIN at each end (can't remember the pin count, let alone the pinout). I think these were just called 'LocalTalk cables'. Each machine added to the LocalTalk network would need a LocalTalk adaptor, and all but one would also need a 'LocalTalk cable'(?) You're probably right about each end being terminated. I feel an ASCII illustration coming on...

```
*T-----T-----T-----T* * = Terminator
[Mac] [Mac] [Mac] [Mac] T = LocalTalk adaptor
----- = LocalTalk cable (?)
```

DA> I have some of these boxes but have never got them
> experimented with. Main reason being how this port
> shares the fast serial port so it's an either or
> proposition.

It's odd that Atari chose to share the UART this way (did each port have seperate line drivers?) Is this true of all the RS-422 equipped Ataris or just the Falcon? I can believe that most people would never have cause to use it, but I can't help thinking it's a port with potential.

DA> I'm sure I'll get around to it some day when there
> are 5 other people left using these boxes ;)

I hope I'm one of them! I should probably try to find out some more about how people use LocalTalk (+ AppleTalk?) for TCP/IP. I don't know how many people this might be relevent to (how many of you are lucky enough to have a fleet of TTs, or even MegaSTEs? =o) but people are referring to the RS-422 port as a 'LAN' port (I have a vague recollection that Atari may have called it that too). I wonder if Atari (or a third party) ever 'followed through' by producing software (and hardware?) to build a LAN of suitably equipped Ataris.

Regards,
- Andy.

Unfortunately, atari-computer.de has been dead for over a week.

While we're on the subject, however, what camera do you use with Photo-Tip and how is it connected to your Atari?

There may well be such a program, but may I suggest looking into
alternative desktops? NeoDesk, Jinnee, and Thing are examples of
programs that do much more than just allow for a picture. Thing is
even shareware.

>Showing my age now.....

Haha. Mostly I'm just kidding around. But yes, I do own a vic20, and an amiga2000. In addition to my 7 or so classic macs, my NeXT, my 3 Apple II's, my dozen or so PC's... and hopefully, someday, my Atari 68k computer. It's the last of the major 68k computers for me to have, and it will be fun to see if I can have it speaking netatalk on the localtalk port. Wouldn't mind owning one of the atari 8bits either, should I have the opportunity.

Well, not cheap. Nonetheless, it should be easy. I've only seen one
firewire to SCSI convertor, but it was hardware only with no software
drivers and consequently I'd suspect it would work on an Atari.

Of course, given the Falcon's maximum data throughput of roughly
2Mb/sec on the SCSI port, a firewire drive would be a ridiculous amount
of overkill.

That's the end of the experiment. One of your fellow group members wanted to get back at some of the annoying people in here. Via proxy of course. That proxy being me.

Most replies consisted of a knee-jerk "fuck off out this group" response. I was hoping for some slightly better defence of the Atari platform. I see the ever popular Outllook Express is in use by most of you. Never knew MS had recompiled it for the Atari ;-)

You would be wrong to assume I hate the Atari platform. I learnt to program on the Atari 800. Had a program published in Atari User magazine, written using my 800XL.

I remember the time when Dixons had the 800XL and 1050 drive together at some stupid price (I think it was ï¿½130). I owned a 520ST (720KB drive) and learnt assembly using HiSoft's Devpac.

My favorite all time Atari expression is "Pseudo colour cycling". I must admit that the 8bit was an amazing system. When you can perform smooth scrolling in one line of BASIC code and then see the ST's first efforts. Thank goodness for the Carebears!

I now use PCs of course. Love 'em or hate 'em you can't escape them. The world's an imperfect place. If it's round, then where are all the corners?

Goodbye...

Harry

701. Geneva/Neodesk&Environmental Settings

I'm running Geneva with Neodesk and cannot get the env settings to work with for example: Olga and Aniplayer as plugin for CAB or clicking on a html link in MyMail to send to CAB,the messages I get are talking about "no pipes" etc...which I know from Multitos,but not in Geneva which is co-operative multitasking,not pre-emptive..I use Geneva because Cubase Audio works under it,in fact i can play back audio direct from disk whilst surfing the net and running other apps,and without errors which a friend of mine can't successfully do on his MacG3...but I digress...does anybody use Geneva and has successfully set up the env variables to get Olga working properly,I'd love to run Everest and CAB to create web pages on my CT II Falcon here .Neodesk supports the Av protocol but the linking between the programs is not happening,the task lisk shows Olga activates and is running but thats it...I hope some of this makes sense,this is my first venture into a discussion group online,much respect to those programmers of Atari software...thanks for any helpl

> of course. That proxy being me.

Not a very scientific experiment. Too many unchecked variables - see below.

> Most replies consisted of a knee-jerk "fuck off out this group"
> response. I was hoping for some slightly better defence of the Atari
> platform. I see the ever popular Outllook Express is in use by most
> of you. Never knew MS had recompiled it for the Atari ;-)

Point 1: It was your typical "idiot trying to piss people off" post.

Point 2: Rational people either ignor these or joke at them, as seen more than anything else, at least here in the newsgroup. Probably 90% of us didn't feel it was worth their time to respond to such stupidity. I didn't until I read that one of our "fellow group members" was involved.

Point 3: Per point 2, most reply posts were *not* the knee-jerk kind. Those who did reply that way are probably just tired of these kinds of idiocies.

Point 4: So what that people use Outlook? I am pretty sure that a good number of us, dare I say most of us, have PC's or Mac's as well as Atari's simply because Atari's aren't exactly the world's best internet machines.

> You would be wrong to assume I hate the Atari platform. I learnt to

We only assumed you hated the Atari platform because of what was said. I believe anyone who really cares about this platform and group wouldn't pull such an immature, unnecessary, and destructive stunt like this one.

> I remember the time when Dixons had the 800XL and 1050 drive together

Well, why not grab one of the many Atari emulators and breathe a little life into that PC? Maybe get reconnected to the group again? Maybe try your hand at programming again for the ST? God knows we can use all the programmers that are out there as possible!

> Goodbye...

I can forgive this stunt, I guess. But why not get back into your real joy and get either an emulator, or a cheap used Atari, or even better, a new clone? Then maybe you could actually accomplish something productive rather than spurring on the wrath of the faithful few.

Why did you allow your account to used via proxy? If you're silly
enough to do that then you SHOULD be accountable for the actions
of those connecting via your proxy...and of course you should expect
that kind of response to come from such a stupid post...

The newsreader choice is entirely upto the user. Using Outlook is
no indication of how vehemently we will defend the Atari platform.
It could have been Newsie on an Atari just as easily (or maybe MORE
easily!) as Outlook on a PC or Mac...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

>While we're on the subject, however, what
>camera do you use with Photo- Tip and how is it
>connected to your Atari?
It is not my intention to interrupt but I think
it can be of a help if everyone who uses
anything connected to their Atari responds when
a certain subject is been asked: you can get a
good overview from what is possible and how the
practice of it is.

I, for instance, use the Olympus Camedia 2020
with Durs Locher (excellent) program on a Atari
TT. Connected to one of the serial ports it
works fine. The program has a lot of capacities:

you can foresee your pictures in thumbnails
which reduces the time spent on downloading. It
gives a very good screenview: it has a nice
interface and Durs is planning to put more
graphical tools in the program so that you don't

have to go to Photoline for instance to rework
your photographes. (Which does not say that
Photoline and Phototip isn't a excellent
combination). Sadly we can't reach Durs now but
it is a great program.
It is still a great joy to see that your ST or
TT can cope with the rest and use items that
like to be only for a PC or Mac..
(If I spoke for my turn, please correct me)

We had must to delete the file on our web site because of maintain
code. Since, we received mail to delete this file because we were not
available to have it on our web site.

BTW, if you want to ask something about Centek or report bugs on
software supported, ask us and not Rodolphe that was out from Centek
since 1 year.

The size of the drive has no influence at all on the speed of the boot
process.

> From my experience my friend has 30gb hd on athlon 862mhz and because it
> has so many tracks and sectors to read at the boot, it takes longer than
> smaller hd (FAT table)

Sure, these checks take some time, but there is no need to run
filesystem checks with each boot process. Actually, I don't know any
operating system that runs a check each time, unless it was configured
to do so.

Hi!

I am going to sell my Atari Falcon 030.
What do you guys I will get for this Atari? I am hoping to get more than
5000 NOK.

With the Atari, I got a printer, some books, programs (like Cubase),
start-up disks etc. and I got a red box from Steinberg (produced by
SoundPool), a Falcon Digital Interface.

I bought this Atari because I wanted to make music with it, and I managed to
make a lot music with it. The reason I am selling it, is because I want to
make music with a normal PC.

Anyone is willing to help me? Or is anyone interested?
Please contact me!

Frode S?nsteb?

Yes that's the ones. Early versions used phone cable later
versions used shielded cable with a mini din on each end with 4 wires
inside. There are actually really early versions of these things that
had a 9 pin serial adaptor on them to connect it to Mac Plus etc.

>

They did on the Falcon and TT. I'm not certain about the MegaSTe.
It does have some potential if you have a need for a network of a machine
and can't easily put it up on ethernet (sound familiar to any platform ;)

However to really make use of it you need someway to hook this network
into a machine that can hook into another network wether that is ethernet
LAN or up to the internet.

> DA> I'm sure I'll get around to it some day when there
> > are 5 other people left using these boxes ;)

>too). I wonder if Atari (or a third party) ever 'followed through' by
>producing software (and hardware?) to build a LAN of suitably equipped Ataris.
>

I know of no atari products that did anything with these ports.
The one that always got me was why no one produced drivers for peripherals
to these ports. There were Mac hand scanners etc that plugged into one of
these ports on the mac.

As to localtalk or appletalk support for these devices. I don't think
that would be neccessary. You should be able to run PPP across them
straight out of the box. It's possible that you need to do a rebroadcast
of the packets back onto the chain so that would take a small amount of
work. But I'm not certain that would be necessary. Wouldn't if you only
had 2 machines ;)

With the 9 pin adaptors you could probably hook up ST's as well.
I'm not certain that it would be any faster than a midi network on them
though as I think the MIDI ports run at a higher rate than the 19200
available on the serial port of an ST. If you go this route though you
would have to have the phone line connectors for all the machines, unless
you had a TT or something acting as a go between routine phoneline
messages out onto the mini din cable network.

> make music with a normal PC.

I can give you one important advice:

Never give an Atari away for a PC !
And never try to make music with a "normal" PC...its horrible.
Once, i did the same.... now i use again a 1040ST (!!!) for making music. It runs the sequencer software and it works and works and works and no timing problems and no crashes an so on. Ok, I use PC's too (for analog recordings), but all timing critical things are done by the Atari (e.g the st genaretes the midi-master clock - a pc isn't able to do this cause theres no real realtime-OS for a PC available).

Greets, Mirko

That is nonsense.

Use a real operating system and a real filesystem (eg. NTFS, ext2, UFS,
reiserfs) and you will not notice performance differences between eg. an
Intel CPU and a comparable RISC CPU.

FAT is fine for floppies. The problems when using FAT on big harddisks
are not caused by Intel but by the OS makers who decided to use FAT for
something which it is not very suitable for.

If you use FAT32 on a single 45GB partition, you will have huge FAT tables -
so either this takes away RAM, or needs additional disk accesses when
booting. Both *may* produce noticeable delays if you do not have enough RAM.

From: phantomm@eastky.net
Message-ID: <93ngn1$3dj$3@nd.eastky.net>
Source record: 51758

I bought the Atari ST game Reach For the Skies new a few years ago.
Instead of the Atari reference sheet which suppose to have the keyboard
command layout and loading instructions, I got an AMIGA keyboard layout and
loading instructions.

Does anyone have the Atari keyboard layout with loading instructions?

I would like to know if there are any special commands or loading instructions
that the manual doesn't cover.

There is a Hard Drive installation program on my original disks, I use it to
install it on the Falcons hard drive.

Also, anyone know if this game will work on the Falcon?

I tried it just using the ST LOW compatibility mode and had some random crashes.
Their Finest Hour, which is a similar game works just fine like that.
(CONTROL KEY BOOT)

If I need to use Backwards, wasn't it released as FREEWARE?
If so where can the latest version be found.

Thanks,
phantomm@eastky.net

All computers impress me. Most amazing machine that humanity has ever
invented, and like so few made today, the atari has a personality. I
appreciate that. Lord knows I won't be playing quake3 on it, but the amiga
can't make that claim either.

Those were the original Apple localtalk adapters. Mini3 plugs, if I remember
correctly. For classic macs, the phonenet style adapters are recommended,
and have the added advantage of using standard telephone wire. Makes it
easier to network 2 macs not in the same room. Farallon made the things,
though belkin and a few others made knock-offs.

I would think that atari reasoned that people who would actually network the
things wouldn't need a serial port also. Then again, I don't know what atari
peripheals actually used the serial port.

>producing software (and hardware?) to build a LAN of suitably equipped
Ataris.

With localtalk, getting tcp to run over it is nothing easy to do at all.
Basically, ip packets are encapsulated in appletalk, so the atari would have
to understand both. PC's running linux that are lucky enough to have a
localtalk card (yes a few were made), can talk appletalk over them fairly
well, and finally are able to do tcpip over them, though I'm not fortunate
enough to get it to work on my own setup.

And if you think a fleet of TTs networked together is strange, then you have
no idea. Should I ever have the opportunity, I wish to network an SGI or
two, a dozen or so macs, and a few ataris using localtalk/phonenet. SGI's
are equipped with rs422s on some models, and there are hacks to get them
speaking netatalk (unix appletalk protocol) over it in a way that macs can
understand. If there is a spot in heaven reserved for the person who created
the craziest computer network ever, I intend to take it.

Thanks,
John

Same day I read this I've got a telephone call from a music school
in Stockholm. A nice lady asked how to transfer MIDI-files from
720k Atari disks to a PC. I told her and I'm going to help her to
transfer some of them, aswell. The interesting part under the
tel session was that she said they're going to use the Atari again
'course it's "realible and stable". Nice words indeed from them,
using Mac and PCs for music production.

736. Falcon clock patch

Newsgroup: comp.sys.atari.st
Date: 2001-01-12 21:44:51 UTC
From: bindon@madasafish.com
Message-ID: <t5uumjmemkor90@corp.supernews.com>
Source record: 51771

Hi

I'm a bit unsure what I have on my newly aquired Falcon :)

I have the Phantom accelerator but there seems to be the possibilty of
a clock patch already installed.

The tell tale signs seem to be pin the track cut from pin 110 of
the SDMA. A small wire is connected from the pin 110 and connected
to pin 8 of 74**08 chip. Then pins 9 and 10 are bridged together
and also wired up to the track that was once connected to pin 110
of the SDMA. Summing that up it's basically intercepting the track
(that goes to pin 110) with an AND gate.

Sounds like a simple buffer to me, or is it something Atari fitted to
make the computer work. If I removed it would the computer fail? The
phantom has a clock modification with it which I'd rather use.

Dan gave me a hint to solve my problem: I deleted the variable NNTP_SERVER in
my STinG configuration files. Now everything works fine again! :-)

The exact set-up that will work depends on the isp but here are a few things
I have learned from trial and error. Personally, I prefer to edit the
default.cfg and dial.scr files to tweak my set-up but if you prefer the
dialer dialog I will refer to that:

1. Under "Addressing", enter the Primary (and Secondary) ip addresses in
the field "Name Server", this field has scroll buttons. The ip addresses
are the dotted decimal ip numbers given in the info from your isp.
eg. 123.456.765.321

2. Fully Qualified Domain Name is left blank for the isps that I use.

3. Most isps also auto-assign an ip address to your Atari when you dial-in
so check the box labelled "Request Name Servers from Remote".

I use Freeola and I have just added the STiNG script files to my humble
web-site. If all else fails then have a look at those as examples and look
at the info on www.Freeola.com and compare it to your own isp.

Regards,

Peter

Take your pick, MacOS X, NetBSD, Linux... <grin> I have found the Mac quite comfortable for several projects, but I'll readily agree that regular (pre X) MacOS didn't multitask the way I was used to. I do like Macs though.

> seems to be able to without any problems. It may be
> co-operative (which I've heard Mac's have been able
> to do for many years), but it's still multitasking,
> isn't it?

Yes, I think MacOS has traditionally used cooperative multi
-tasking, at least since the days of MultiFinder. I suspect
this is less crippling for MacOS apps than DOS ones (and perhaps Windows ones?)
because MacOS apps spend more time in the operating system, and are used to
being event driven. (hopefully there are some programmers in here who can
explain this better ;o)

I think pre-emptive multitasking should be more smooth in theory, but I wonder
if half the problem isn't programmers' assumptions and design philosophies.
I'm more used to system software where multitasking is a given, so it irked me
at first to be presented with dialogue boxes that demand your immediate
attention, and won't let you do anything else until you've pacified them.
Hopefully this attitude is less common these days though.

Regards,
- Andy.

Hi,

I currently use a program ccalled DESKPIC.

It uses 256 colour GIF files for the imagses and tiles these accross the backdrop.
The only problem with this program is that it is sooooo slow.

I have a 14mb Falcon with a hard disc and it take about 50 seconds for it to boot!!! about 5 for software and 45 to sort out the GIF. Go figure.

Tim

Actually, the camera I use is not connected to the Atari. I use a Sony
camera that puts the picture on 3.5 inch disk. I just take the disk out of
the camera and insert it in the Hades and off I go....

I could be wrong. It's been years since I've played with the guts
of a Falcon. But it sounds somewhat like the Bass mod for the sound
system that was atari prescribed. I wouldn't remove it unless you
discovered that you needed to.

But I could be wrong. I'm just reading news waiting for friends
to come over to go out to dinner :)

I suppose it would be ok. WD IDE-drives have been hard to use on the Falcon,
but I don't think they are when it comes to SCSI. You need an adapter if
it's a Wide-disk though...
If you find out that it works, please let me know, so I can add it to the
list of compatible HD's I have on my website.

:>with Black Night and transfer files between the two. I'd love to get
:>StinG working through AppleTalk so I can have the Falcon online as well
:>as the Mac.

: I've discussed the possibility of such with a few friends before. Sadly,
: none of us actually own an ST... the focus of our somewhat comical debate
: was whether netatalk could be could be made to run through the rs422 port on
: an SGI. The SGI's rs422 isn't mini8 like the Mac's... though that would
: hardly be a problem. The biggest difficulty would be in matching the signal
: levels and impedance and such. Might require a non-standard transformer, and
: none of us were expert enough to say one way or the other.

: Providing that it is truly localtalk compatible, it might be worth your
: while to grab a phonenet adapter for the thing, and try to compile netatalk
: for the Falcon. Would require a bit of code monkeying, to be sure.

Keep in mind that Localtalk refuses to work even on a Mac running a
multitasking system. It uses some really tight control of the ports in
order to attain the Localtalk 230 kbps speed. Of course, the serial
interfaces of the Falcon or SGI could be a better implementation, not
requiring the same minute control.
Another alternative might be IP over Localtalk, but I wouldn't know if
that runs some encapsulation in order to transfer the IP on the bus
structure.
On a similar note, I was in an electronics shop today and found a rather
unexpected Amiga 500 expansion called Doubletalk, which claimed to be
Appletalk compatible. So it should be feasible even on a multitasking
system.

Hi,
The CPU-clock modification is in fact nothing but a buffer that cleans up
the clock pulses, which originally are anything but the clean square wave
they should have been... :(
Check out the CPU-clock modifications on my website and see which one it is.
Then you'll know how to set it back to it's normal, unmodified state again.

Yes, that's a kind of DMA patch. I haven't seen this version before, but
it's definitely a DMA clock patch.

>>Sounds like a simple buffer to me, or is it something Atari fitted to
>>make the computer work. If I removed it would the computer fail? The

It's not an original Atari mod.

>>phantom has a clock modification with it which I'd rather use.

If SCSI and DMA sound works fine you shouldn't mess with the patch,
because it's not always trivial to get it working perfectly. However, if
you have SCSI/sound-problems, fix the cut track and install the Phantom
clock patch. Accelerated Falcons usually require a different patch than
standard.

: Those are indeed what I had in mind - well, sort of. The ones we used on
: Macintosh didn't use phone wire, but some sort of cable with a mini-DIN at each
: end (can't remember the pin count, let alone the pinout). I think these were
: just called 'LocalTalk cables'. Each machine added to the LocalTalk network
: would need a LocalTalk adaptor, and all but one would also need a 'LocalTalk
: cable'(?) You're probably right about each end being terminated. I feel an
: ASCII illustration coming on...

Dan is probably thinking of the alternative PhoneNet wiring, wheras you
(and I) are thinking of the mini-DIN 3 wiring which Apple favoured.

: *T-----T-----T-----T* * = Terminator
: [Mac] [Mac] [Mac] [Mac] T = LocalTalk adaptor
: ----- = LocalTalk cable (?)

The terminators are integrated into the Localtalk "transceivers", though
they were required on PhoneNet.

: DA> I have some of these boxes but have never got them
: > experimented with. Main reason being how this port
: > shares the fast serial port so it's an either or
: > proposition.

: It's odd that Atari chose to share the UART this way (did each port have
: seperate line drivers?) Is this true of all the RS-422 equipped Ataris or just
: the Falcon? I can believe that most people would never have cause to use it,
: but I can't help thinking it's a port with potential.

I've got a little device here which connects a Localtalk node or network
to ethernet. That's potential for you.

: DA> I'm sure I'll get around to it some day when there
: > are 5 other people left using these boxes ;)

: I hope I'm one of them! I should probably try to find out some more about how
: people use LocalTalk (+ AppleTalk?) for TCP/IP. I don't know how many people
: this might be relevent to (how many of you are lucky enough to have a fleet of

: TTs, or even MegaSTEs? =o) but people are referring to the RS-422 port as a
: 'LAN' port (I have a vague recollection that Atari may have called it that
: too). I wonder if Atari (or a third party) ever 'followed through' by
: producing software (and hardware?) to build a LAN of suitably equipped Ataris.

No. They didn't.

: However to really make use of it you need someway to hook this network
: into a machine that can hook into another network wether that is ethernet
: LAN or up to the internet.

Such boxes have existed, and then we also have the routing/masquerading
capabilities of STiNG/MiNT or IPNetRoter on the Mac.

:> DA> I'm sure I'll get around to it some day when there
:> > are 5 other people left using these boxes ;)
:>
:>TTs, or even MegaSTEs? =o) but people are referring to the RS-422 port as a
:>'LAN' port (I have a vague recollection that Atari may have called it that
:>too). I wonder if Atari (or a third party) ever 'followed through' by
:>producing software (and hardware?) to build a LAN of suitably equipped Ataris.

: I know of no atari products that did anything with these ports.
: The one that always got me was why no one produced drivers for peripherals
: to these ports. There were Mac hand scanners etc that plugged into one of
: these ports on the mac.

Seem rather silly when there were absoilutely fine parallel ports, which
are sorely lacked on the Mac.

: As to localtalk or appletalk support for these devices. I don't think
: that would be neccessary. You should be able to run PPP across them
: straight out of the box. It's possible that you need to do a rebroadcast
: of the packets back onto the chain so that would take a small amount of
: work. But I'm not certain that would be necessary. Wouldn't if you only
: had 2 machines ;)

PPP is by definition a Point-to-Point Protocol, so running it over a
network with >2 nodes seems nigh-on impossible. One would have to settle
for another protocol.

: With the 9 pin adaptors you could probably hook up ST's as well.
: I'm not certain that it would be any faster than a midi network on them
: though as I think the MIDI ports run at a higher rate than the 19200
: available on the serial port of an ST. If you go this route though you
: would have to have the phone line connectors for all the machines, unless
: you had a TT or something acting as a go between routine phoneline
: messages out onto the mini din cable network.

MIDI runs at 31250 bps.

: easily!) as Outlook on a PC or Mac...

Just as easily, eh? Then tell me why so few here seem to be using Newsie,
or Okami, or Oasis, etc? Why is everyone using Outlook? Becuase it runs so
painlessly on their Ataris?

As you can see from the above, an Atari is GREAT for Midi. Another reason to keep the Falcon: Now there is so much great Midi software available. For example Algo-comp tools like Tunesmith, M, RealTime, MidiDraw, MidiJoy, Music Mouse, Sequencers like Omega KCS , Master Tracks Pro, Tiger Cub, Edit Track, plus plenty of Patch editors: ALL the caged Artist series, CZ android. And much more. Just check out my site.

Also we have a growing Atari-Midi list with nothing but musicians talking about Atari. We just had a BIG Falcon/CAF discussion. You are welcome to look at the messages.

I think most people here would own a Mac or PC as well as their Atari. Often those PC's or Mac's are sold with a net connection, which is convenient for them. They could still use their Atari with its specific newsreaders if they wished...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

> I have a 14mb Falcon with a hard disc and it take about 50 seconds for it to
> boot!!! about 5 for software and 45 to sort out the GIF. Go figure.

Hi Tim,

I use Deskpic 5 too, but you can make it load MUCH faster by doing the
following...

Boot up as normal, get to the desktop. Then open the Deskpic DA, click
on 'Speichern' on the right hand side (under 'laden'). This lets you
save the current screen in what I think is deskpic own internal format.
Select somewhere to save it and call it <picture>.GFB. The suffix MUST
be .GFB. Click 'Sichern' on the bottom of the Deskpic dialog to save the
setting, and reboot. You will notice the image loads MUCH faster.

I use 800x592 resolution in 256 colours, and I have scanned 800x600 JPEG
pictures to use as desktop pictures. They take about 3-4 seconds to load
when I save them as a GFB...

If you have JPEG's, load them into GEM-view 3.x with octree palette and
Floyd-Steinberg on, when GEM-view finishes loading save the picture as a
256 colour X-IMG, then load the saved picture into deskpic. Dont close the
picture loaded in GEM-view or exit GEM-view through this time. At this point
the colour palette goes silly, but click OK in deskpic to close the DA, and
make sure the image you need in GEM-view is the top window. Open the deskpic
DA again and do the save GFB thing. I can send you a picture of my desktop
if you wish, to see how cool it looks.

Email me direct if you have trouble with doing this and I'll see if I
can help
make sense of my rushed instructions here!

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Hi,

I'd like any recommendations of any Atari-friendly ISPs in the US (particularly in California). Basically, I'd like an ISP that isn't hard to set up with STinG. There are so many that it's hard to choose one. I'm thinking of sticking with one of the larger ISPs like PacBell or Earthlink. I'd also prefer one with no sign-up fee.

Any recommendations?

Thanks, Phil

Hi,

My impression is that NEON, the 3D program, does
not like NVDI and/or MagiC. Does anyone else has
the same experience and knows what can be done
about it? I like NEON very much and was vry
useul in the past before I installed some other
programs and I do have to use it now. I also use
Cybersculpt en Xenomorph but on the TT with a
graphic card (NOVA) they work allright though in
a very small screen and NEON doesn't. (And being
over 40 my eyes....)

Thanks in advance,

Raoul Teulings

Same feelings here, although I remember "Rings of Medusa" and "Patrizier"
keeping me on my toes for months also. Both these games were German, I've no
idea if they ever were translated. Especially Rings of Medusa was one of my
favourites... Railroad Tycoon and Pirates were also nice contenders, but none
of these had the same "magic" as Civilization...
Sim City was about the only game with that style of play I didn't like.

Hi,

>Alas, I no longer seem to recall where it is - or if I still have it
I still have it. It came with my first 520ST that had no TOS on board, once loaded I was left with about 265Kb RAM to work with... I bought the ST in june 1985 and had to wait until early february 1986, before obtaining a proper TOS in ROM from Atari.
The disk is of the Single Sided type and there's nothing special about it except that it contains a small program in the bootsector (some stupid viruskillers recognise this as a unknown virus!!).

The best way to copy it is with a copier that copies the entire disk, including the bootsector. If anyone wants a copy I'll give it the MSA treatment which copies the bootsector also...
I've got a Fench and American version....

Oh... just to keep it legal anyone wanting to use this program should remove his TOS based ROM first :-)

Cheers from Belgium

Hello Dan!

DA> ...It does have some potential if you have a need for
> a network of a machine and can't easily put it up on
> ethernet (sound familiar to any platform ;)

I'm thinking that a network of TTs (cue commedy dream shimmer effect) could be built using this port without going to the expense of adding an ethernet card to each one. A natural progression of that might be to have one TT with a (VME?) network card that could act as a router if the rest of the machines needed Internet connectivity.

DA> However to really make use of it you need someway to
> hook this network into a machine that can hook into
> another network wether that is ethernet LAN or up to
> the internet.

<grin> I wrote my previous paragraph without having read that, it sounds as though we're thinking along similar lines!

DA> The one that always got me was why no one produced
> drivers for peripherals to these ports. There were
> Mac hand scanners etc that plugged into one of these
> ports on the mac.

Perhaps they assumed everyone had their network plugged in there! <grin>

DA> As to localtalk or appletalk support for these
> devices. I don't think that would be neccessary.
> You should be able to run PPP across them straight
> out of the box.

I agree that AppleTalk shouldn't be necessary, and would probably be tough to implement anyway. The only advantage might be to have TTs and Macs on the same LocalTalk network, but it might be more simple to have separate nets with appropriate protocols for the TTs and Macs (perhaps with both nets being routed onto the same ethernet).

I think PPP is just point-to-point, but I was wondering last night about a star configuration with the Atari machines hanging off something like a terminal server. One of the advantages of this would be that it could work with STs that lack the 'LAN port'.

At first the terminal server could be plugged into a SPARCstation or something whilst the software was developed, but eventually it might be possible to embed the computer with the terminal server. Such a setup might find applications

other than Atari networking which might justify the development expense.

It would probably just be cheaper to write router software for a TT with an ethernet card though! =o)

DA> With the 9 pin adaptors you could probably hook up
> ST's as well. I'm not certain that it would be any
> faster than a midi network on them though as I think
> the MIDI ports run at a higher rate than the 19200
> available on the serial port of an ST.

I wondered about that too, but I'm reluctant to tie up the MIDI ports. I imagine that many of the STs currently used in industry have survived courtessy of those MIDI ports. That said, if people expressed sufficient interest it might make sense to do an ST equivilent of the 'LAN port' routing software that worked through the MIDI port. The MIDI port should run at 31.25 KBpS (I think), how fast will the TT, Falcon and MegaSTE 'LAN ports' go?

Regards,
- Andy.

That sounds familiar, 'phonenet' definitely rings a bell. Did the phone wires
use RJ-11 connectors, screw terminals or something else?

J> With localtalk, getting tcp to run over it is nothing
> easy to do at all. Basically, ip packets are
> encapsulated in appletalk, so the atari would have to
> understand both.

I had a vague recollection that was how it was done. Perhaps someone can
suggest an alternative protocol that might be appropriate?

J> PC's running linux that are lucky enough to have a
> localtalk card (yes a few were made), can talk
> appletalk over them fairly well, and finally are able
> to do tcpip over them, though I'm not fortunate enough
> to get it to work on my own setup.

I imagine that might be useful to route packets between a Macintosh LocalTalk
network and the outside world. Do you know if this is also possible with a
(suitably equipped) Mac running Linux?

J> And if you think a fleet of TTs networked together is
> strange, then you have no idea.

I'm not saying it's strange, just that for me, at present it's wishful
thinking! =o)

J> Should I ever have the opportunity, I wish to network
> an SGI or two, a dozen or so macs, and a few ataris

> heaven reserved for the person who created the
> craziest computer network ever, I intend to take it.

You'll have some stiff competition, but it's good that I'm not the only person looney enough to try! Netatalk sounds promising, it suggests that AppleTalk is sufficiently well understood (documented?) to be re-engineered. If no Apple -Talk implementation exists for TOS, I can't help wondering if a protocol might be applied (devised?) that would be more efficient than tunneling IP through AppleTalk. If an appropriate protocol doesn't exist as an open standard, it might be an interesting project to devise one. Hopefully it could be run on your SGI workstations too.

Regards,
- Andy.

771. Jumpers on Epson SMD300 floppydrive?

Newsgroup: comp.sys.atari.st
Date: 2001-01-13 15:28:13 UTC
From: Ovikspojken <ovikspojken@telia.com>
Message-ID: <jgq06tg6tdj50vsh8r73gdovbqt1iras9m@4ax.com>
Source record: 51649

Hi
I'd like to move my floppydrive to a PC, from my Falcon.
Do anyone know how to place the jumpers for PC-use?
I had it written down once, but :-(
rgds to all atariowners out there!
Kjell

773. Need help with Supra hard drive

Newsgroup: comp.sys.atari.st
Date: 2001-01-13 16:56:03 UTC
From: "Ralph E. Dodd" <redodd@home.com>
Message-ID: <DM%76.134223$w35.22884882@news1.rdc1.nj.home.com>
Source record: 51654

Hello all,

I just got a 20 MB SupraDrive with no software or documentation.
What software is needed to access this drive and where can I get it?
It has one cable about 2 feet long with a 19 pin connector. On the back
it has one 19 pin female and one 25 pin female connector. I assume that
the 19 pin female would be for adding another drive. Is the 25 pin another
printer port? Thanks a lot.

Ralph

Hi,

Just tried that idea of pressing the 'Speichern' button and it is sorted
now. I think it decompresses the Gif into something more like a bitmap
because the image is now 3x the size.

By the way, I am only using Dekpic V1.05 where did you get V5 and how much
was it?

Hi everyone,
bit fed up with being unable to get Atari downloads off my
PC.I would like to get my Ste up and running for downloads,e-mail,etc.I
know you can get an upgrade for the modem port.Anyone know where I can
either buy it or get the instructions to make it.

Also, what is the latest software to enable me to do the above.I am
running a 4MB Ste, Tos2.06 with 250Mb hard disk,CD Rom and Med_Rez
monitor.

Cheers,

Chris.

777. IRC problems

Newsgroup: comp.sys.atari.st
Date: 2001-01-13 17:50:18 UTC
From: jfhaslam@zetnet.co.uk
Message-ID: <3a60955a$0$173@news.zetnet.co.uk>
Source record: 51658

Hi all!

Thought I'd forward this onto this newsgroup, although they are mainly talking about a PC virus/worm, I know that some of you use PC's on IRC a lot now! And possibly it may shed some light on the problems many of us are experiencing getting onto IRC?

The following is from: newtochat@egroups.com ("Pete Carr")
Received: by zetnet.co.uk (mbox zetnet.co.uk/jfhaslam)

The last week has seen several hacking attacks against the two major IRC Networks, Dalnet and Undernet. On Dalnet, this has resulted in not being able to log into a Dalnet chat server, or being disconnected frequently. On Undernet, the channel robots, X and W, were hacked into, causing a disruption in the individual chat channels.

Both Dalnet and Undernet are working to restore full functions, and delays will be experienced until such time as both Networks are finished with repairs.

The attacks were what is call a "DoS" Denial of Service attack...In a DoS attack, a small remote control program is loaded into thousands of unsuspecting persons computers, and, at a given time, the program activates and logs into one of the Networks, causing an overflow of connections, and shutting down the Network.

The latest program being used is called remote_server_notif.exe Go to your Explorer and perform a file search for this file. If it is in your computer, delete the file, and clean the Recycle Bin.

Remember not to accept any file from anyone you do not know while in IRC Chat, and be sure and set your DCC Send to Ignore.

For more information, Please visit the Undernet IRC Network Home Page at http://www.undernet.org For an update on their status.

If you have any questions please feel free to reply at any time.

Thanks,

Pete for Chatmag.com

End of Original message

Cheers!

James

778. JPEGD for Falcon

Newsgroup: comp.sys.atari.st
Date: 2001-01-13 18:10:01 UTC
From: phantomm@eastky.net
Message-ID: <93q5lp$bc6$1@nd.eastky.net>
Source record: 51663

Regarding JPEGD.PRG for FALCON

I know that there are several versions of the JPEGD program that goes into the AUTO folder of the Falcon for speeding up the loading/viewing of JPEG pictures.

I think that BrainStorm were the ones that made these?

Anyone know if the program is still being updated?

If not, which one was the last version by file size and date?

And is the last version the fastest and best to use?

I did find on my hard drive a Jpeg viewer program by BrainStorm, did they have a complete package for modifying/viewing Jpeg and other pic formats?

If so, is there a URL for the complete package?

780. Merging R, G, and B

Newsgroup: comp.sys.atari.st
Date: 2001-01-13 18:19:25 UTC
From: phantomm@eastky.net
Message-ID: <93q67d$bc6$2@nd.eastky.net>
Source record: 51662

Using a custom digitiser on a Falcon I can digitise a Picture from TV/VCR or etc and get a RED, GREEN, and BLUE grab of the same picture.

Now is there a small simple program that would MERGE the R, G, and B picture Grabs to form a 256 color picture or better?

And is there a simple program that would do a series of RGB pictures like the above into a common ATARI, PC, or MAC Video format such as MPEG, MOV, FLC, FLH?

Any info on this subject is much appreciated.

My point was that there were Mac peripherals that hooked into a
compatible port to what exists on the TT/Falcon. Some of which there were
cartridge port adaptors for. Just thought it was funny that there were no
direct drivers for these devices.

You seem to have some slight confusion here. PPP and SLIP are
just encapsulations of data. Running PPP between 2 machines is no problem
at all. If you had a more proper networking setup you wouldn't be
worrying about PPP or Slip at all. But there is nothing to stop their use
with the lack of alternatives. The main reason people avoid using PPP is
that PPPD is more complex to setup on a Linux/Unix box than a SLIP
connection.

784. Atari ST 'Commandments'

Newsgroup: comp.sys.atari.st
Date: 2001-01-13 19:07:03 UTC
From: computerclassics@my-deja.com
Message-ID: <93q90l$t5g$1@nnrp1.deja.com>
Source record: 51665

Hi All,

Does anyone know what the last four 'commandments' were that Jack Tramiel issued regarding the marketing of the Atari ST? I've only been able to uncover the first 6 from the magazines that I have in my collection. I've included the ones that I do have below. Thanks!

Bill Gaskill
www.timeline.99er.net

During Tramiel's early days at Atari he brought out the ST line and surrounded it with a lot of fanfare and marketing hype. Among the most remembered hype was "The Atari Ten Commandments":
1. We shall create a computer that will be a landmark in the history of computers.
2. We shall create a computer that is as smart as the buy who buy it.
3. We shall create a computer that sets a new standard for speed and performance.
4. We shall create a computer that lets consumers choose what is right for them.
5. We shall create a computer that gives consumers power without the price.
6. We shall create a computer that is as powerful in the music studio as it is in the office.
7.

Hej Kjell,
You should be able to see some text beside the jumpers on the drive. For use with an Atari, the jumper must be set to DS0 (DS stands for Drive Select) - but for a PC, it should be set to DS1 since the twisted cable for the floppy takes care of the id-numbering then.

Hi Ralph,
The Supra is a SCSI device, so the 19-pin cable goes between the Atari's
DMA-port to the 19-pin connector on the drive - while the 25-pin is for
connecting additional SCSI-units.

>
>These two items are mutually exclusive BTW.
>

Hi Derryck,

If they are mutually exclusive then why does the dialog allow both to
be entered ? Wouldn't it be better if the check button greyed out
the input field ?

I have had to alter my set-up recently due to changes at my isp that
they didn't notify to anyone !!!

Although I did once read the STiNG docs I now work by trial and error
and this is very difficult when Tech Support at the isp is for PC/Mac
only. It doesn't help when they deny any changes and then admit to
them 20 days later. Grrr!

I managed to get it to work this way and I tend to leave it well alone
once it works. They had changed the Primary/Seconday ip addresses and
unless the correct ones were entered it did not resolve anything even
with the check box ticked.

I have just removed the two ip addresses from my set-up and it still
works so it looks like the manually entered ones override the check
box.

I think I was consfusing it with the ip entry under Port Parameters.

I am getting very good performance from CAB and a 33k6 modem, about
5600 bytes per second with Dan Ackermans ovl. I don't know what the
theoretical limit is perhaps someone could enlighten me some more.

Earthlink (for me) has been reliable but is'nt "free" (about $20/mo.)
Setting up StinG was straight forward but pay attention to the extra
character(s) needed in the Login script (ELN/username).

Rj-11 jacks, and standard 4 conductor phone wire could be used as network cable. Terminators consisted of a 120 ohm resistor crimped into an rj11, outer paitr, if I remember.

Unless there is source code for "atarinet protocol" rotting in some vault somewhere, this seems the most appropriate choice to me.

Actually, I think Apple freewared such software, but it runs on MacOS. Linux can do such, and I would think that PPClinux keeps up with everything fairly well. Tentative yes.

Appletalk is sufficiently understood, but don't mistake this to mean
'simple'. I agree with what you say, but any help I give really has to wait
until I actually own an Atari. All my searches have been in vain, up to this
point.

Thanks,
John

I hope you bought that device. I've learned the hard way never to pass up
hardware today, that I may want tomorrow.

As to whether localtalk could work on an atari, no matter what it will be a
challenge.

Thanks,
John

With atari we are luky we can choose everything.
the screen, the picture, and the palet...and the format, often the img, ximg
native atari format are the best support.
It is true with all the machine, don't forget bigscreen.

Hi Dan,

with one or two, but no more, Java using pages, I've managed to get a bit further along the path by looking at the source in JOE and cutting and pasting into CAB any URL's I find.

Bob King.

Hi Dennis

(I hope that is your name as I remember it)

Welcome back. I remember many a posts a few years ago. Sorry to hear
you have had trouble with your TT keyboard. You can get a new MYLAR for
it from Best Electronics. I think it is only $30.00. If you can find a
Mega keyboard, that makes a good replacement as well. I did that with
my TT and it works fine . I like it BETTER then the TT keyboard.
Several keys on my TT keyboard were going out like the CONTROL key.So
when I got a mega, I switched keyboards.

What Astro-soft do you use on your Atari? I have an old one from Atari
Corp itself..mostly to memorize constellations and stuff.

The (usually two, hence primary/secondary)
DNS IPs are not the same as the IP assigned
to your machine. They're the addresses of
servers which resolve domain names to IPs,
and are static, as opposed to dynamic.

TT 230k

Falcon theoretically 230k more reallistically I think 115k is
pushing it. Depends alot on what else you are doing with your falcon.

MegaSTe? I don't know. I think it uses the same SCC for this
port.

If you are really desperate for slow ethernet take a look at
Farallon. They've been selling off there old mac/Powerbook adaptors.
They plug into the compatible port. You will need to get an external
power supply for them thought as the included cable hooks into the Mac ADB
port. They had them on sale recenlty on the coroprate web site for $30 US
I think or somewhere in that range.

However 230k ethernet is kind of a questionable statement ;)

804. ** SIO2PC under 800XLDJ Questions

Newsgroup: comp.sys.atari.st
Date: 2001-01-14 10:37:20 UTC
From: Greg Goodwin <Greg.Goodwinp0.f2.n8.z8@fmlynet.org>
Message-ID: <0001.3a61e229@fmlynet.org>
Source record: 51707

FamilyNet HQ: Telnet:\\www.family-bbs.net

Greetings, I have a few questions about the SIO2PC under the Atari ST program 800XLDJ. What I am planning on doing is getting this program to run under the Atari ST similator "MagicMac". If I can get this working, then Macintosh users will FINALLY have some solution to create virtual drives for their Atari8 computer.

If this doesn't ever work, I'll try APE under SoftPC.

My questions for everyone out there...

1) Have you ever used 800XLDJ? (800XLDJ is basically the ST's answer to the APE interface, providing 8 virtual drives for a true Atari8 computer to access the drives off the ST's hard drive via a SIO2PC (or "SIO2ST" as we like to call it) cable.)
[If you have never used this program, proceed no further, thanks for you time. If you have, please continue on the questions...]

2) What Atari 16/32 bit system did you run this on?

3) What system (Magic, Mint, Linux, regular TOS, etc...) was running on your 16/32 bit system? (Would love to hear from Magic users on this in particular)

4) and other screen accelerators (NVDI, Warp9, Geneva, etc) was running on this system?

5) (Optional) if you have MagicMac or MagicPC and ran this program, what kind of setup did you have?

Many thanks in advance!

Hi all...

I purchased one fo the Farrallon adapters but could not get my TT to access the LAN port (RS422 port) to access it... I kind of gave up at the time. I tried it using MagiC. I'd like to get it going usign either MagiC or MiNT but buying N.AES is kind of a pain here in the US so I don't really have much use for MiNT w/o a desktop.

Anyway, anyone with suggestions on how to get my TT with MagiC to pipe TCP/IP through the LAN (RS422) port so I can plug my Farrallon adapter into my Ethernet network would be greatly appreciated... GREATLY... I'd be willing to give away a copy of the Paradise Presentations package I'm working on now... maybe make the person a beta tester?

Try the sites below for the latest software. If you want to get online and use a graphics browser, Cab is what you will need, but you have to do in mono. That is what I did with my STe and it worked fine. Med color is ok for mail and using the text browser in Newsie. I would also use STiK2 as it is much easier to setup and use.

Hi Eick!

This also happened to me once before. I couldn't get it to work no matter what I did.

Then I tried reinstalling Cab. Figured it couldn't hurt. Problem solved. I can only think that the download module happened to get corrupted or something.

Try it, it may work also for you! I actually installed it on a different partition and recopied the modules directory over (keeping the ovl in there).

I haven't had problems downloading ever since.

Cheers!

James

From: xlator@cix.compulink.co.uk
Message-ID: <93staugh1@plutonium.compulink.co.uk>
Source record: 51710

Can anyone tell me just what is physically different on partitions that have LFNs enabled in MagiC (either in MAGX.INF or with VAFATCONF)? And what changes when you use the Temporary enabling in VFATCONF - are the LFNs accepted only while this is on? And shortened again with it off? If so, permanently, or do they return when you switch it on again?

Also, it seems that VFASTCONF doesn't affect a CD-ROM. At least I couldn't disable LFNs on mine by switching it off temporarily. BTW, at first I couldn't see LFNs at all on Z:, but this was due to the use of V2.4 of ExtenDOS. Switching to a newer CD driver brought them up fine, although Thing 1.27 truncated *very* long filenames to 32 characters; I understand that later (beta) versions allow more. I only got the names in their full glory after switching to jinnee, which allows up to 64 characters in file/folder names.

Regards, /Peter/

To get the system to address the port you need to set it up as
such. I think HSmodem will do this. You basically just have to set a bit
to on to redriect serial 2 to the lan port.

As to making the device work that is a different matter. Ask
farallon if they would be willing to open source the specs for the device.
It might happen. Tell them they could probably get rid of the rest of
their stock if they did ;)

Hi

I,m having a a little problem with Magic 6.10 on my Falcon which is very annoying. The keys work fine under TOS outputting the correct letter into any text editor. Under Magic keys like z and y and swapped over and most of the keys to the right, like the at sign are wrong. I tried running magic under a barebones szstem, HDDriver and Magic, with no shell (using the file selector dialog) and it still gives the same results.

Mazbe I should see what the mapping is like in the NVRAM but it seems verz odd that it does work under TOS and it was working a few dazs a go.

Sorrz for the bad spelling ☹) Damm I can☹t even do a smiley!

Ataris.

I have 2 Falcon's and a MegaSTE, and half a dozen phoneNet adapters, which I
have been dying to try out. I have tried once with Duet, but I don't think
it could cope. Beside's the obvious fact that it only works using 2 Atari's.
My thort was why not use Tcp/Ip? Sting should cope, then as you guy's say
use a single Atari with a Network card as a gateway. My only real problem
is, how do you map drive's using Sting? Is it possible? Any thought's?

Source record: 51722

Hi,

can anyone point me to the cause & a possible repair for my TT's monitor.

When I start the TT up from cold the screen starts jumping left and right in small blocks. Once it has warmed up there are no further glitches.

I thought I better look into iut and possibly have it repaired before the screen fails totally.

Any suggestions greatfully recieved.

Julian

This should work with an appropriate wide to narrow adapter that
terminates the unused data lines.

It sounds like your Keyboard is set-up for German (under Magic), I have a German TT so TOS is screwed with the 'z' and 'y' (try doing a backslash, 3 keys).

In Magic you can change it to English but I cant find it, I need to know what you do too.

Sorry not much help.

Mark.

This argument was used in the early ST days in reference to certain inefficiencies in the Intel CPU code in order to maintain backwards compatibility, but I have never heard it used in reference to hard drive booting.

It is nice to hear you respond on Centek's behalf. I think it was everyone's understanding that Centek was out of the Atari business, and that we had to go to Rodolphe for Centurbo support. He has been very helpful to me, and just repaired my Centurbo free of charge.

The 5000 NOK you originally mentioned is a good price, actually somewhat generous with all the extras you are offering. You might offer it on ebay with a minimum bid of $500. You might also get more by offering the extras separately. But if you need money, you might search for other options as you might later regret selling your Atari.

Source record: 51613

Hi all,

been on the road again....
Now i&#65533;m back home examining the loot. I bought a Falcon in an original case, but with the top and front covered with a grey steel plate. The original keyboard has been removed. On the left side of the front panel there&#65533;s a switch and three LEDS. The switch isn&#65533;t doing much, the red LED is an on/off indicator and the green LED is an HD active indicator. On the right side is a connector for a standard PC/AT keyboard. The mouse connection is(alas) standard Atari. There&#65533;s a 1 Gb Toshiba IDE drive inside, i got a VGA adapter, a great Agiler mouse and THREE trackballs with it! All this for 160 Euro!

QUESTION 1. Does anybody know the brand or any other info about this Falcon upgrade kit? Could be Dutch or German i think. (Bought it in Holland)

QUESTION 2. Does anybody know how to remove a Falcon 68882 FPU without damaging the FPU or the socket? In DoitF030 i read that you need special tools for this? I&#65533;d like to remove it from my "old" original Falcon and put it in the Falcon-in-case described above.

OK, thanks!
The 0 to 1 solved it, after a little fiddling with the jumpers it
worked, but there are 16 pins and 3 jumpers!
Why so many, can it work on f.e. Amiga or Mac also?

Hi Starlord

>My old Falcon030 is sitting in a box awaiting new life, when I placed an
>ide hard drive in it the power supply blew, it can't carry the load.

What do you mean blew?, did the fuse fail, and if it did have you tried a replacement. Falcon supplies wont fail with excess load, they'd just go into rejenerative trip mode, and stay like that indefinately with no harm occuring. SO if your PSU failed it wasnt because of the extra load.

I know peop's who have C2's and fat hard drives in their machine with no ill effect.

My mate Shiuming also offers a street blue-lighting service with his falc and other internal extras, and all on the standard PSU. :-)

I most sertainly prefer Okami on the TT compared with OE5 on the pc. My
pc mostly act as a simple gateway to a Telia ADSL line so I can use Okami
on the Atari without adding to my phone bill. CAB v. IE5 is another
story, though...

Yes he could do, but there isn't that much of a benifit over AHDI when a HD is under 100mb. It's simply the fact that AHDI is free, and a lot better insome ways than ICD tools. I've never had the joz of using the Supra Utilities.

>regulator.

There is no 12V regulator on the Falc supply, regulation is based on the
5V rail, the 12V rail just follows along as it comes from another winding
on the chopper transformer.

If excessive load is placed on the supply the Falc PSU will just trip
until its removed. If anything else happens its because the PSU was
faulty to start with, last straw syndrome. The Falc supply is capable of
very severe overload conditions.

This could be a problem with the TT itself. The next time your system is cold, switch off the monitor, boot the TT and leave it for the time it would have took to settle down, after an extra period of time for good luck, switch on the monitorm does it exhibit the same problem.

If not its the TT thats problematic, if it does then youve confirmed a monitor fault.
I'd investigate the PSU firstly, wait for it to come up to temperature and to start off, squirt individual capacitors in the PSU with freezer spray, wait a few seconds, if/when the display fault appears youve hit the faulty device. If this doesnt show problems up then go squirting capacitors in the Line output, take note there are lethal voltages present in any section of the monitor, more so in the power supply and the line output. If squirting caps dont isolate the prob then pick on another device type and work on like this. Good luck.

The Falcon did not have an IDE drive in it, I used it for 4 years with a Syquest. Then after moving over here I got a IDE drive (85meg I belive) from a guy up in Ridgecrest,Ca. I installed the drive and when everything was set, I powered up, the power supply started 'clicking' and nothing would come up. I opened it up and unhooked the hard drive and tested by powering up again, still nothing, not even the floppy drive. So I figure something went KBAM in the old power supply,(Fuse is ok), so it's been waiting for me to get a replacement for it, as my TT has been waiting for a replacement of the keyboard, but I've not had the $125.00 free for that yet, figured maybe the PS might not be so costly. I read in an english Atari magazine there was an outfit over there that sold a wire setup to go between one of those multi-switching PC powersupplys and the input of the Falcon. I think I could find one of those PS's used and chaep maybe out here in the desert.

Source record: 51600

Hi,

I was wondering if anybody could tell me how big a Deskicon.RSC file can be.

I only ask because I can make one that uses a lot of new icons and takes up about 500Kb and during booting, I get an out of memory error.

I am using a TOS 4.04 Falcon with a 3.2gb hard disc and 14Mb of Ram.

Tim

Hi Dan,

>So I wonder how many they have sold ;)
Supposing that the Milan II existed and was for sale I would say none... How anyone can possibly think of selling Atari products online to Atari users, on a website that needs JavaScript to access it is beyond me. So this is either a scheme to get rich quick or otherwise the maintainer of that site is simply a moron....

Cheers from Belgium
Dennis

Hi mark,

>In Magic you can change it to English but I cant find it, I need to know
>what you do too.
You need to put an English keytable.sys file in the Magic extension folder.
This file remaps the keys in MagiC, so that they correspond with an English
keyboard. Alternatively you can also download Keytables 1.02, which does the
same thing but offers a bit more bells and whistles.
http://www.jumpgates.com.skydiver

Boths files are in your and Lyndons mailbox right now :-)

>It sounds like your Keyboard is set-up for German (under Magic), I have a
>German TT so TOS is screwed with the 'z' and 'y' (try doing a backslash, 3
>keys).
To remap a German TOS for an English keyboard, take a look at CKBD 1.3 or
clocky 3.01, both these programs can be found at the chapelie ftp server..

Cheers from Belgium
Dennis

Source record: 51603

I have the Supra Utils, that are not that bad at all.

You get a number of programs to format, partition, etc along with some other bits and pieces, they have easy set-up for the drive that 'they' put in but you can also specify a number of setting for 'foreign drives (my brother took a 30Mb and put in a 400 Mb plus a CDROM, no problems).

I think it may even support the older version of the Supra drive too (TTL, etc), there is also a utility to read the clock if your controller has one.

If anyone is interested I may be able to find them.

Mark.

>
>Hi Derryck,
>
>If they are mutually exclusive then why does the dialog allow both to
>be entered ? Wouldn't it be better if the check button greyed out
>the input field ?

My apologies, Shiuming points out later in the thread the error of my statement. Your IP address is dynamically assigned at login, unless (rare) you have a permanent IP address. The name server address(es) are either listed by the particular ISP or are assigned dynamically - it's that box you tick in the dialer. However, it does seem that you understood my message :-)

>Although I did once read the STiNG docs I now work by trial and error

I've found that little needs to be changed from one ISP to the next - the PPP protocol is meant to sort out the nitty-gritty itself.

>I have just removed the two ip addresses from my set-up and it still
>works so it looks like the manually entered ones override the check
>box.

Ticking the box "fetch dns from host" or whatever it's called in the dialer, and saving the result results in the dns address(es) being removed from your script.

>I am getting very good performance from CAB and a 33k6 modem, about
>5600 bytes per second with Dan Ackermans ovl. I don't know what the
>theoretical limit is perhaps someone could enlighten me some more.

I doubt you'll get anywhere near it :-)

It was very quick at Christmas though :-)

I've gone back to Olivier Booklage's overlay as Dan's sometimes fails to download any data, unless it's "one of those things" which sometimes afflicts the internet!

873. Misc Atari ST Items FS/Trade (USA)

Newsgroup: comp.sys.atari.st
Date: 2001-01-16 13:08:03 UTC
From: Fred Horvat <fmh@netzero.net>
Message-ID: <3A6447B3.EAE9F6CC@netzero.net>
Source record: 51604

Hi,

Here's some Atari ST stuff that I'm not using
anymore. Those are my asking prices. I'm open to offers.
Buyer pays shipping. I am also open to trade offers.
E-mail me your list to fmhcom@operamail.com or for
more info.

My want list is near the bottom of this list.

HARDWARE

I have a real gem here. The only known stand alone Atari 2600
computer system made. The Bit60 Computer made by Bit Corp.
Spectravideo made an add on adapter for the 2600 console.
This is a fully functional computer and 2600 game system.
This is the 2600 computer system reviewed in
"The 2600 Connection" issue #30 Sep/Oct 1995. I am pretty
firm on the price since this is not something your going
to find at a local flee market or garage sale. $1,000.00

Atari PC-1 Computer System. This is Atari's first attempt
at the IBM clone market. The IBM clone is in an Atari Mega ST
case with a 5 1/4" 360K floppy drive instead of the standard 3 1/2"
ST drive. It has an 4.77/8.0 mhz CPU with 512K RAM. Has dip
switched Video Adapter for MDA/CGA/EGA graphics. CPU comes with
an Atari IBM keyboard, Atari labeled MS/DOS, Atari labeled
GEM Operating system, and manuals that are photocopied. Serial
Number is #0007 so besides being very rare it's one of the First!
Also included is an Atari PCM124 mono MDA/CGA/EGA monitor in the
box with paperwork. For both computer and monitor $250.00

Falcon Speed by Sack Electronic
Intel 286-16mhz IBM processor board for the Atari Falcon computer
Run DOS and Windows 3.1 programs on your Falcon
Norton SI Factor of 12
Sound Support
Up to 8 Meg of IBM RAM
VGA and SVGA video modes 640x480, 800x600, and 1024x768 under Windows
3.1
Switch back and forth between TOS and DOS modes $90.00

Spectre GCR by Gadgets by Small. This is the Apple Macintosh emulator
for the Atari ST/STe/TT/Falcon computers. Includes cartridge, disks,

box, and an extra disk of misc ST utils. $30.00

Fast Fax by Michtron. This is the original fax hardware/software
for the Atari computers. Works with ST 520 to Falcon. This is a
special Michtron 9600 Send/Receive Fax Modem with software. The
software is very efficient, powerfull, and simple. Send, receive,
view, log, and print, faxes. has drivers for popular printers and the
SLM804/SLM605. Use a spare 520 or 1040 floppy only as a stand alone
fax machine. Comes with special fax modem, diskettes, and manual.
$30.00

Atari Portfolio 64K Memory Card. This unit is new but I can't
guarantee that the battery is still good due to it's age. $10.00

AtariSoft IBM Games
** Note ** these games are made for the IBM PC on 5 1/4" floppy
These were made in 1983 when Atari was making games for multiple
computer and video game consoles. All the games bellow are
BRAND NEW and never used! Games are $15.00 each shipped.

Battlezone *sealed*
Centipede *sealed*
Defender *sealed*
Dig Dug *sealed*
Galaxian *sealed*
Gremlins *sealed*
Jungle Hunt *sealed*
Moon Patrol *sealed*
Pacman *sealed*
Robotron 2084 opened
Stargate *sealed*

GAMES

Imperium Game manual and registration card from Electronic Arts.
I no longer have the disks or box but for someone who needs
the docs here you go. $1.00

S.D.I. by Mindscape. Complete with box, docs, and disks. $5.00

Plan 9 From Outer Space by Gremlin. Complete with box,
docs, and disks. $10.00

Road Runner by Mindscape. The ST version of the arcade game.
Obviously with the Road Runner and Wile E. Coyote.
Comes complete with box, docs, and disk. $5.00

Star Raiders by Atari. The classic Galactic Adventure game.
Comes complete with disk, box, and docs. $5.00

Test Drive by Accolade. The classic driving game for the
ST. Comes with box and disks. $5.00

Hard Drivin' by Tengen. The awesome arcade game on the ST.
Comes complete with disk, docs, and box. $5.00

Star Raiders by Atari. The classic Galactic Adventure game.
Comes complete with disk and docs. $5.00

Elvira Mistress of the Dark by Accolade. Explore the 800 room
castle in this huge adventure game. Comes on 5 floppies.
Comes with box, docs, and disks $10.00

Snoopy The Cool Computer Game by The Edge. Snoopy, Woodstock,
and the rest of the Peanuts gang. Linus has lost his blanket
and Snoopy has to find it. Comes with box, docs, and disk
$5.00

Pipe Dream by lucasfilm Games. The classic Pipe Dream game in
one and two player modes. Comes with box, docs, and disks
$10.00

Gem'X by Kaiko. Kind of a Tetris type where you have to match
the computer's pattern on the right side. Box states there are
400 levels. Comes with box, docs, and disk
$5.00

Spelling Bee by Atari. The scholastic series spelling program
for kids. Comes with box, docs, and disks.
$5.00

MISC SOFTWARE

ST Control by Trio Engineering. A BASIC like language that
is closer to using normal language to program. Example
"Draw picture with Neochrome" Includes box and diskette
no manual.
$3.00

MultiTOS by Atari. Premptive multitasking for any ST, TT, or Falcon.
Comes complete with binder, manual, and on 720K floppies
$15.00

Dac Easy Accounting by Dac Software. A complete accounting system
for your Atari computer. Comes with disks and manual.
$5.00

Degas by Batteries Included. The classic garphics and drawing

program for the Atari ST platform. Comes with book and disk
$5.00

HiSoft BASIC Professional by Michtron. This version has a fully
integrated BASIC compiler and editor to create compact and quick
Atari programs. Comes with large manual, box, and disk
$15.00

BOOKS $5.00 each unless noted

Compute's Technical Reference Guide to Atari ST TOS Vol 3.
Includes fully commented C and machine language examples. $5.00
Thunder! The Writers Assistant manual. $1.00

MAGAZINES

I have a large selection of mostly 80's and early 90's Video Game and
Computer Magazines, Books, and Newsletters for various systems.
Please E-mail me for a current listing.

CD-ROMS

Whiteline Linux by Delta Labs. Atari Linux Distribution 1.1C.
Run Linux on your TT030, Falcon w/FPU, or 030 ST w/FPU. Has a
very simple installer. Just answer a few questions and away it
goes.
$15.00

NetBSD by InfoMagic. Install this Unix implementation on your Atari
TT030 or Falcon. Besides Atari there is IBM, Amiga, SUN, DEC ALPHA,
Macs, VME, HP3000 distributions on this 2 CD set.
$15.00

WANTED

MagiC Mac Ver 6.XX
CAB 2.7 or higher, full version or upgrade
AIXIT TT RAM board or any TT RAM board with at least 16 Meg
MagiC Ver 6.XX for Atari, full version or upgrade
NDVI 5.XX full version or upgrade
Atari Jaguar Battlesphere
Falcon MKX Case

OTHER Platforms

I also have lists of software for other platforms like IBM, XXX CD-ROMS,

OS/2, Mac, and Amiga. If interested please request a list.

>Can anyone tell me just what is physically different on partitions that
>have LFNs enabled in MagiC (either in MAGX.INF or with VAFATCONF)? And

LFNs are stored in a different area of the disk from the 8+3 filenames.
Programs which don't understand LFNs are kept happy that way.

>although Thing 1.27 truncated *very* long filenames to 32 characters; I
>understand that later (beta) versions allow more. I only got the names
>in their full glory after switching to jinnee, which allows up to 64
>characters in file/folder names.

Atari Workshop in the UK sell jinnee, I heartily recommend it as a modern
desktop to accompany MagiC.

| . . . .
|If not its the TT thats problematic, if it does then youve confirmed a
|monitor fault.
|I'd investigate the PSU firstly, wait for it to come up to temperature
|and to start off, squirt individual capacitors in the PSU with freezer
|spray, wait a few seconds, if/when the display fault appears youve hit
|the faulty device. If this doesnt show problems up then go squirting
|capacitors in the Line output, take note there are lethal voltages
|present in any section of the monitor, more so in the power supply and
|the line output. If squirting caps dont isolate the prob then pick on
|another device type and work on like this. Good luck.

I have taken a couple of monitors to a local workshop to get fixed.
The main part of their work seems to be re-soldering all the joints
in case they are dry.

881. Removing Falcon FPU

Newsgroup: comp.sys.atari.st
Date: 2001-01-16 18:20:47 UTC
From: Freek Munniksma <freek@munniksma.myweb.nl>
Message-ID: <9423tl$71r$2@azure.nl.gxn.net>
Source record: 51614

Hi all,

been on the road again....
Now i&#65533;m back home examining the loot. I bought a Falcon in an original case, but with the top and front covered with a grey steel plate. The original keyboard has been removed. On the left side of the front panel there&#65533;s a switch and three LEDS. The switch isn&#65533;t doing much, the red LED is an on/off indicator and the green LED is an HD active indicator. On the right side is a connector for a standard PC/AT keyboard. The mouse connection is(alas) standard Atari. There&#65533;s a 1 Gb Toshiba IDE drive inside, i got a VGA adapter, a great Agiler mouse and THREE trackballs with it! All this for 160 Euro!

QUESTION 1. Does anybody know the brand or any other info about this Falcon upgrade kit? Could be Dutch or German i think. (Bought it in Holland)

QUESTION 2. Does anybody know how to remove a Falcon 68882 FPU without damaging the FPU or the socket? In DoitF030 i read that you need special tools for this? I&#65533;d like to remove it from my "old" original Falcon and put it in the Falcon-in-case described above.

>are wrong.

Obviously Magic is set-up for German language. AFAIK there is a "regular"
way to change the keyboard layout, but besides that, it seems that
it can be adapted by carefully digging into MAGIC.RAM with a hex editor.
Look for the sequence "QWERTZ" ...

883. What was MultiGEM?

Newsgroup: comp.sys.atari.st

From: vdjole@EUnet.yu
Message-ID: <9424gl$2tt$2@SOLAIR2.EUnet.yu>
Source record: 51616

Just curious...

Browsing through some old magazines I came upon an article on software called "MultiGEM". Obviously it was an early attempt on multitasking, maybe an AES replacement/adaptation?

Did MultiGEM have any family ties with Magic or Geneva or NAES or something else ? Was it any good? Why did it disappear into oblivion? What was it (in)compatible with? Can it be found somewhere on the Net?

Cu.

:-) The one thats connected to the 5V rail via a 470 and 2200 ohm high
stability resistors, guess what?.

>> 5V rail, the 12V rail just follows along as it comes from another
>>winding on the chopper transformer.

>Yes, for IC 3 :)

Nope, IC3 is the reference for the over voltage protection circuit, and
is referenced to the 5V rail...

Regulation is done with collector current simulation via a feedback
winding off the pulsh width modulation driven FET chopper.

Try unplugging the keyboard as well, check for breaches in the insulation
of all the ribbon cables that may short against the sheilding.

Give it a shake and make sure no screws have dropped into the system.

Best to buy a small tool that can be only a couple of ukp or even
less. If you are careful and know what you are doing you can try
prissing it out very slowly with a small screwdriver, but I really
wouldn't recommend this method. Get the tool, as it's not worth the
gamble.

So what you are saying is that if I use HSModem to redirect the output from the serial2 to LAN I could pipe TCP/IP via STing/STick out that port and over my network if I set up STing/STIck properly... hmmm... it's crazy enough it just might work!

Seriously though, I didn't know HSModem could switch ports and I've been trying to figure out how to do it. I'll have to give it a shot. As for the Farrallon EtherMac iPrint device, according to Farrallon's docs it's just a dumb gateway between the Mac's ethernet port and a serial pinter which is bi-directional so it should work with no modification...

But since theory and reality rarely meet I think I'll call them about it anyway...

Thanks for the info!

It's up to the comm's package to pick what port to use. Hsmodem only
supplies enhahaced bug free version's of the driver routines that TOS uses.
All it does is clean up the MFP and SCC routines, and the Lanport
(localtalk) uses the SCC, Modem2 on the Falcon, I think from memory. So
redirect connect/stalker etc to use localtalk and away you go..

Mark

It can be set within HSMODEM but easier would be to use Peter
Rottengatter's "Serial Ports" cpx that comes with STinG. STinG should be
perfectly usable via the LAN port as several people have reported here.

Hi all,

Yes Photoline will do this. The first thing to do, under Tools, is Convert Picture: Grey to RGB, you will see no change, but without this, any grey level will be replaced by the luminance level of the replacement colour ie another grey. Then grab the grey colour level you want to replace with the pippette. Then go to Tools, Replace colour, pick up the pippette grey from the foreground pallete and drop it in the Source color box, set the tolerance. Do the same with the replacement colour and drop it in the Target color box, set tolerance, and execute. You will need a lot of trial and error, but it works.

Bob King.

> Salut a plus tard...

I have tried 2X16Mo sims (no EDO) and the computer crashes on the "M46"
accessory with a message in german :((

I'm sure that the memory works great because I use it on my Amiga... the
Medusa works like a charm with 2X8mo of TT-RAM but not with 2*16Mo...

This memories are standard SIMS 60ns no EDO (I don't try the EDO before to
be sure that the computer doesn't "burn" with it).

I wasn't lucky enough to grab this deal. Mine was the 90quid bundle with just the 1010 datacorder. It cost me another 50quid to get the 1050 secondhand.

Not here any more. It got burgled (except for the 1050 which was the most valuable part of the setup IIRC) along with my first 520STFM!

If anyone's like me they'll have tried to grab this NG for free at
work using Outlook. I did, but it was so horribly crap and unreliable
I aborted the attempt and started logging back on with Newsie.

I use Groupwise at work for internal and external Email and it's also
quite hideous. Seemingly incapable of using an external editor and any
attempt to use the tab key sends me to the file attachments area -
what kind of shite is that?!

So, that MS and Novell dispensed with. Thank God for atarisofts...

The only version I'm aware of is the one included with CAB_JPG.OVL by
Dieter Fieblkorn. It's the Brainstorm version (PRG and ACC).

Ha ha ha.... maybe the system crashes everytime. So when windows bootup, it does a filesystem check.

But the probable reason is that the CPU is so fast in shutting down that the cache in the HDD is not fully flushed yet. This is most likely to happen in larger HDD with larger cache. See Microslop knowlegde base for their explaination and patch.

909. Collector's List

Newsgroup: comp.sys.atari.st
Date: 2001-01-17 04:21:30 UTC
From: hughfalk@mindspring.com
Message-ID: <9436k4$254$1@nnrp1.deja.com>
Source record: 51637
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit,comp.sys.amiga.games,comp.sys.ti

To all computer game collectors,

In order to build and even larger community around classic computer gaming,
GOTCHA (Gaming Obsession Throughout Computer History) is adding an official
collector's list to its site. This will just be a simple table of people
who collect computer games, their contact info and what platforms they
collect (Atari, Apple, TRS-80, Commodore, etc.) It is similar in scope to
the list that Digital Press hosts; however, Digital Press's list doesn't
track computer games (beyond Atari 8-bit carts), and GOTCHA won't track
console games. If you collect computer games, please take a minute to fill
out this form:

http://www.emuclassics.com/gotcha/collector's_list.htm

You'll then be added to the list, which will be on display at GOTCHA
(http://www.emuclassics.com/gotcha/). You may find some collectors local to
you. Once I get a few names, I'll post the initial list. Then it will be
updated regularly. Please pass this message on to whomever you think might
be interested.

Best regards,
Hugh Falk

If my memory serves me correctly, MultiGEM allowed you to load
applications into the desk accessory slots. You could then switch
between applications and the desktop. Although this did not provide
true multitasking it did allow you to load and switch between
several applications.

Hope this helps.

What type/speed of Ram does the Falcon use?; is it easy to upgrade, like
just changing a few SIMM or is it more complicated than that?.
Also why is it upgradable to 14meg when digitally speaking you would expect
this to be 16meg (1,2,4,8,16)?.

Thanks,
Stephen Moss

Hi,

The memory in the Falcon is a specialist card.

I bought a SIMM adapter for Keychange music, This has allowed me to take it
to 14mb.

The SIMMs used are single sided FPM SIMMs, it doesn't like double sided or
EDO SIMMs.

I think is 14mb limited by the MMU but I may well be wrong.

Tim

Indeed it does - it also works under MagiC :-)

About the only irritation is that you have to visit another menu option to
set the print range for a statement - this option should have been built
into the Print menu. The usage of ALT+key shortcuts in the menu bar is also
non-standard.

924. MiNT/MagiC/AES advice needed

Newsgroup: comp.sys.atari.st
Date: 2001-01-17 16:05:02 UTC
From: Laurence Shields <laurenceshields@mindspring.com>
Message-ID: <944fqn$8e8$1@slb7.atl.mindspring.net>
Source record: 51557

Hey everyone,

I'm an Atari fan and lately I've been reading about all these things you can add that can make life better for my little machine. At least I thought so. The problem is, I am a little confused by the terminology and all of the products available and I need some advice from the "power-users". So here goes.

I have MagiC 5 right now and am considering upgrading to MagiC 6 but I don't really use MagiC a lot. Partly because some programs don't like it (Notator SL, etc) and partly because I'm put off by the German-language oriented parts of it. I find that the icon handling seems to be pretty clumsy, too, compared to my normal OS (TOS 2.05 w/ Icon Juggler). I'm one of those freaks who like to be able to customize the look of everything. :)

I know next to nothing about MiNT except what most MiNT fans would call myths (that MiNT is hard to use and so on). Is it really harder to use than MagiC? Is it worth the trouble?

I have no idea what a AES is or where mine is located. NAES just makes matters worse. But I'd like to know, if it's not too complicated.

To sum up, I'm a musician. I have several Ataris but my main machine is a Mega STe w/ 4 MB, TOS 2.05 and a 48 MB hd. I use Notator SL, Logic, X-oR, and a few others as well as some expansion boxes (Unitor, LOG3, Export). A lot of the info out there about MagiC/MiNT/NAES stuff seems to require some programming knowledge with terms like "kernel", "VDI", "scripting", and so on being thrown around. I'm interested in learning about these things but, you know, I only have so much time and music is my main passion. Not computers. I've also no interest in high-level graphics programs or surfing the net with the Atari. Mainly just music stuff.

So should I go ahead an upgrade to MagiC 6? Or should I get into MiNT? How could a new AES help me?

Sorry for such a loooong post and so many (probably stupid) questions, but I need advice from people who really know this machine and I figured this is the place to ask for it. I'm looking forward to hearing everyone's opinons.

Thanks in advance!
Laurence

That's not an IDE cable. What you are looking at is an old style
MFM/RLL interface. The wide cable carries data and the narrow cable is
control. If you want to replace the drive you must use (in the case of
the MF30) an RLL certified drive. IIRC the largest drives from that era
were 150MB or so and were full height so you wouldn't be able to put the
case back together.

Right, and the other 2mb I think are used for memory mapped devices like the ST. One of the more annoying "features" of the Falcon, why they couldn't use standard simms goes beyond me. Probably some reason for them to make money, I'm not sure. The 030 IIRC can access 4Gb of space.

>SL, etc)

For midi I recommend not using Magic. You say you don't really want to
use it for anything but Music so you wouldn't see the advantages.
Have you got NVDI. This is about as reliable and compatible as software
can get, it greatly enhances sreen redraws. Things move smoother,
like the stave.

>I know next to nothing about MiNT except what most MiNT fans would call
>myths (that MiNT is hard to use and so on). Is it really harder to use than
>MagiC? Is it worth the trouble?

It is more for the technical gurus. You need to know how to edit
configuration files. Mint part is quite easy to set up but again, you
wouldn't see much advantage.

>I have no idea what a AES is or where mine is located. NAES just makes
>matters worse. But I'd like to know, if it's not too complicated.

AES is the Applications Eviroment Service. It's the part of TOS that
handles windows and icons, and such. The AES in TOS doesn't support
multitasking, so installing Mint on it's own doesn't provide a proper
multitasking enviroment. That's why you need a replacement such as
NAES or XaAES. Magic includes this part.

>To sum up, I'm a musician. I have several Ataris but my main machine is a
>Mega STe w/ 4 MB, TOS 2.05 and a 48 MB hd. I use Notator SL, Logic, X-oR,

>on being thrown around. I'm interested in learning about these things but,
>you know, I only have so much time and music is my main passion. Not
>computers. I've also no interest in high-level graphics programs or surfing
>the net with the Atari. Mainly just music stuff.

I admit that the terminolgy is difficult. A couple of years ago, I
hardly knew anything. Also 4mb of RAM isn't much to run a "big"
system on. Magic/NVDI uses quite a lot of it. Then you need a

desktop (the visual front end that you see and use). Magxdesk
supplied with Magic is neat and small, right up to something like
Jinnee that is quite big.

>So should I go ahead an upgrade to MagiC 6? Or should I get into MiNT? How
>could a new AES help me?

Maybe you'd like to try out just a new desktop with NVDI? Try Thing
out, it won't give you multitasking, but it does give you a lot more
options.

>Sorry for such a looooong post and so many (probably stupid) questions, but I
>need advice from people who really know this machine and I figured this is
>the place to ask for it. I'm looking forward to hearing everyone's opinons.

Don't worry, if you don't ask you won't know. I was once in a
situation like you so I like to help out.

I understand DHCP, DNS, etc but the problem is that the labels in Sting are vague - the 'Server Assigned IP' (or whatever it is) does not work, I will find out the DNS servers actual IP addresses and add them manually.

When I tried this before (admittedly with some foreign DNS server addresses) it did not work and the dialogue which displays the addresses you have is not the that user friendly.

Mark.

Hi John,

As I always say, I could be completely wrong, but I feel much safer when browsing on my Milan than with my office PC. The whole 'Net world is keyed up to finding out as much detail as they can about whoever may be looking at their web site. With 'Accept Cookies' switched off, I feel safe from prying eyes, hackers, FBI, Tony Blair or whoever. It's a small price to pay for not being able to download a few smart arse java sites.

Bob.

Well I have and use both. I have Magic 6, N.AES 1.2 and Geneva. All work
fine, but I use Magic mostly. I would upgrade to version 6 in Magic and
also get the N.AES 1.2 CD.

> > >USB 2.0
> >
> > What does AGP stand for???
> Advanced Grapic Port,

Accelerated Graphics Port. An Intel
development to alleviate PCI bus
congestion by ever-faster graphics
rendering processors. AGP differs from
PCI in that it doesn't have to share its
bandwidth with other devices, and the
different versions have the following
bandwidth, compare to 32-bit 33 MHz PCI:

- PCI: 132 MB/s at 33 MHz
- AGP 1x: 264 MB/s at 66 MHz
- AGP 2x: 528 MB/s at 66 MHz with double
edge triggering (data latched at both edges
of the clock)
- AGP (v2.0) 4x: 1,056 MB/s
- AGP Pro: As AGP 4x but with
higher power supply rating for
hungry workstation-class adaptors,
hence longer slot for extra pins

AGP gives the graphics card
very fast direct access to system
memory which can be used to
store texture data. It can also carry
address signals on side-band lines,
seperate to the 32-bit AGP, for even
more bandwidth, although at least nVidia
recommends against this.

Unlike PCI, AGP also supports
command pipelining for yet even
more bandwidth.

> a variant of the PCI bus used in all current PC

It's not a variant. It's electrically,
logically and physically independent.
Although some might say its spec is
a super-set of PCI, if that can be
considered a variant. I guess so.
Just remember that PCI is multi
master multi-target as opposed to
single-master single-target (AGP).

Using Magic you can put separate *.RSC files into one resource folder
(don't need DESKICON.RSC). I currently have 912K in various RSC files in
the folder without any problems. I think I ran into the same limit 500K
using TOS.

Hello,

About a month ago, I ordered some atari hardware from
who I think is a reputable dealer.
(They are spoken of on this site)

I do not wish to mention the name of the dealer or the country.

I paid for the product in full, and was emailed that it was being
shipped.

It has been more than a month now.

My local post office says it should take 2-4 weeks if mailed
parcel or 5-7 days if air mailed.

Well, I have emailed the sender a couple of times with no response.

Is there anything that I can do about this?
(Besides calling)

I think you've answered your own questions. If you're not that
interesting in computers per se and only use your Ataris for music,
stick with what you have, don't bother with either MagiC or MiNT. And to
be honest, a 4Mb Mega STe won't like MiNT at all. But if you would
really like to upgrade your system, you should upgrade your hardware
first.

IIRC ICD Pro will only run with ICD-type host adapters, which won't have
been in his old HD I think. Or is it the non-pro version - I can't
recall now. I used both happily for many years but switched to HDDRIVER
for my Falcon as Pro wouldn't work; it also offers more options and
seems faster. But I agree it's overkill for an old, slow 100 MB HD.

Make sure you've got the english translation of HSModem, available on
Derryck Croker's site. There are a range of settings explained in
SCC_X.TXT.

Should you upgrade to Magic 6? Only if you like Magic 5. Apparently,
you don't.

Should you get into MiNT? Perhaps, but it will take some time to learn.

How could a new AES help? Well, multitasking, drag and drop, and
certain other things are nice, though not mandatory.

Just as an idea, try Geneva. The demo is free and it would give you a
change of pace, if nothing else.

Yes, you can post details here. Just be very careful everything you
post is completely factual. You can also ask the shipping company to
trace the order. Other than that, you're stuck. Keep up the emailing.

Agreed. It might be best to think of the Atari as something other than a computer. If you think of it as a "dedicated timing engine" or something you'll soon realize that what it does, it does reliably and inexpensively.

This is actually why I asked. The models Olympus sells in the USA
differ from those sold in Germany. For instance, the D-360L is a
fairly reasonably priced entry level camera, but will it connect to the
Atari with Photo-Tip? I have no idea.

Hello everyone,

Now that it's the new year, I've got some money looking to be spent and so I've emailed both Homa Systems and Systems for Tomorrow regarding availability of items. Neither have responded.

Has anyone actually been able to contact either of these two companies over the last few months? If so, at what email address?

Thanks for helping,

>Danno

Unless I'm missing something here just boot up to the desktop then insert
the disk you want to copy.
Click on the Floppy A Icon and holding the left mouse button down drag the
floppy A icon over the floppy B icon until the icons colours invert.
This should start the copy proceedure, just follow the instructions.
If you come across a "Destination Disk is not the same as the Source Disk"
alert message while trying to copy the disks let me know and I will tell you
how to get around it.

Note:
Are you sure some of the disks have nothing on them as the anti piracy code
inserted into some bootscetors prevents the filenames from being displayed
when you open the floppy.
This is usually found on programs that autoboot (run automatically when the
floppy is in the drive and the computer is either switched on or reset).

Which of the Smurf modules would do the job?

I did read the manual, I guess I missed something in the translation.
I used Smurf to generate the grey scale image from a Photo CD but got
stuck at that point.

I have an original diskette with the WERCS resource editor (published by Hisoft), but the disk is damaged. I need it again to make some modifications to my old softwareprojects.

Help anyone?

Frank.

970. Sacramento area Atarians? (Want to form a club?)

Newsgroup: comp.sys.atari.st
Date: 2001-01-18 17:23:50 UTC
From: William Kendrick <nbs@bolt.sonic.net>
Message-ID: <GEF96.47$94.1728@typhoon.sonic.net>
Source record: 51502
Cross-posted to:
comp.sys.atari.8bit,alt.atari-jaguar.discussion,alt.games.video.classic,rec.games.video.atari,alt.games.lynx,comp.sys.atari.st

I'm curious if there are many Atari users in the Sacramento area.
(I live in Davis and work in Sacramento)

If so, would people be interested in creating a new users group?

I am aware of the Yolo Atari Club, but unfortunately I moved to Davis
just in time to attend YAC's very last meeting. (A core member moved out
of town.)

I also recently discovered that the San Leandro Computer Club is still in
existance, but they're very far away, focus mainly on PC's now, and most
importantly, their meetings are on the same day that the
Linux Users Group Of Davis meets. (I'm president; kinda need to be there.)

My main interests in the Atari realm are 8-bits, Lynx and Jaguar,
as I own at least one of each. My experience in clubs include co-founding
(and now running) a 150+-member Linux user group, and a much smaller
(and more informal) game design club.

My reasons for wanting a club would simply be to hang out, play games,
have fun, and possibly even do some hobby development! :)

Anyone interested!?!

I never was fortunate enough to see PFM Plus, so I don't know how good
it is, but after a lengthy search of the home account software I could
find I gave up and went to Quicken 8 for DOS. It is however, run
entirely on my Falcon, using the freely available SoftPC.

Many older games are quite difficult to copy by standard means due to anti-piracy coding. This coding didn't really stop the pirates, but it does stop most people. What I would do is to attempt a standard copy and see if it works. If not, there are programs (that I haven't used in years) that can copy a disk exactly, anti-piracy code and all.

Ironically, I don't really bother backing up my games for most of them can be obtained off of pirate sites. Should any die, I'll either go there or send out a call for help to this group. In ten years of being an Atarian, I've noticed that very few disks go bad if they are stored in holders away from heaters, sunlight, and magnets.

Hmm, I wonder if something is going on with my email at home. Could
you post the address you used to contact them? I'll try again from
work.

I made a request about updating HD Driver, but it went unanswered
by SFT. This was back in November if I recall and would be
the the first time Ken has not replied to one of my mails.
Might be for the best, I requested 7.x something but I guess
I would prefer a v8 upgrdade now. ;-)

Playcycle Launches the Next Generation Video Game Exchange

"New Site Gives Gamers an Exclusive Trading Venue"

NEWTON, Mass., January 9, 2001 - Playcycle, Inc. launches http://www.playcycle.com/, a web-based exchange designed exclusively for the video game community.

Dedicated to gamers, Playcycle gives enthusiasts the greatest flexibility when they are looking to buy or sell video games, consoles, and accessories. The overall secondary video game market is valued at $1.3 billion.

At last, gamers can:

*Tell the community what they want to buy, as well as what they have to sell
*Choose from fixed price, negotiable price, auction, or reverse auction formats
*Find exactly the games they want, then compare and track them quickly and easily
*See the entire market in real time across gaming platforms and transaction formats

At Playcycle, Members can post Seeks and Offers for the new and used video games, consoles and accessories they want to buy and sell - posting and membership is free. The owner of the listing is billed only $1 in the event of a successful transaction, and there are no other required fees.

From the beginning, the Playcycle team worked with video gaming enthusiasts across the country to create a site that fulfills the needs of one of this nation's fastest growing communities.

Michael Thomasson, of Good Deal Games (Lexington, Ky.), a renowned online game dealer, was so impressed that he has made Playcycle the premier outlet for two newly published Sega CD games, Star Strike and Bug Blasters: The Exterminators, for which he has recently secured publishing and distribution rights.

"The uncomplicated fee structure and unique interface will draw gaming enthusiasts and dealers alike" Mr. Thomasson said, "And since the site is dedicated only to video games, Playcycle can assess and respond to the ongoing needs of this close-knit community, as they did when building the site."

The Playcycle team will continue to improve http://www.playcycle.com/ in the months ahead, adding newly requested functionality and content. Playcycle is "All Games All The Time!"

Raoul,

What software *is*..?

I remember great times using MultiGem on my 1040ST (which does not boot
anymore since 2 weeks..:-(..

You own 3 TT's? Wow....

If I found a good-priced HD (supra or whatever silent(!)) I could get my
MegaST2 up and running....what bugs where the most annoying in MultiGem? Do
you know?

>download any data, unless it's "one of those things" which sometimes afflicts
>the internet!
>
Yes, I've had this too for some time now Derryck. I find that if I "stop"
the page loading (if it's stalling) and restart it, it then generally
starts to download. I also found a while back that Dan's Ovl would
crash with that "conection reset by peer" message. It's catch 22, cause
Olivier's OVL is *very* stable with STinG - never had a crash, but doesn't
support cookies very well while Dan's does but displays these other
characteristics - which maybe why it's having problems? :-)

The following list has a small description of the cartridge label condition, if it does not say box and manual beside the game, than the game is loose. All games work. I am currently looking for various Genesis games, some boxes for the Genesis and box art inserts, manuals ete. Also need a Game-Gear screen magnifier (unscratched, preferably new) and finally the Castlevania series for the good old NES. I am looking for alot more, but I can not think of everything now. I have ebay references if you can not provide references than you must send first, I am tired of all the headaches. If there are any questions please email me. Here is the list:

ATARI 2600
Berzerk- good
Canyon Bomber- good
Carnival -(Slight damage on top, nothing major.)
Donkey Kong- (Label slightly cracked on top from age, nothing major.)
Donkey Kong Jr.- (Label slightly cracked on top from age, nothing major.)
Earth Attack -(Rare Zellers game. Has slight label peeling on one corner, nothing major.)
Espial -(Rare game. Label slighly peeling in top corner, nothing major.)
Fast Food -(Tear on front label, hard to notice.)
Journey Escape- very good
Jr. Pac-Man - good
Keystone Kapers- (label kinda sucks.) poor
M*A*S*H -good
Megamania -(Activision labels are horrible!) fair
Mouse Trap -(Some plaque on label, not to bad.)
Reactor- (Nice label for a Parker Brothers game.)
Realsports Baseball- very good
Sky Diver- very good
Space Jockey- very good
Spider-Man -(Label is not that great)
Starmaster -(Some plaque on top of label, nothing major.) very good
Super Cobra- (Okay label, for a Parker Brothers game.)
TAZ - excellent
Tennis (Some Plaque)- good
Towering Inferno- excellent
Turmoil- good
Venture- (Top Label has some peeling, slight discoloration, nothing major.)

ATARI 400/800 COMPUTERS
Note to all Atari Computer collectors: I may be auctioning (on Ebay) Mr. Do's Castle shortly, yes this game exists and I have it, the label is

white and black, it seems to be a complete game since it gets really hard at later levels some may remember that I had this up on Ebay about a year ago but I had to stop all auctions at the time because for family reasons. The cartridge is mint and works perfectly. Ask me about this awsome find.
Moon Patrol- very good

COLECOVISION
Blockade Runner- (Rare game, has a handle.) excellent
Buck Rogers Planet of Zoom- excellent
Cosmic Avenger- (Some label fading on top.) good
Gorf -(some discoloration on top label, nothing major) fair
Ken Uston Blackjack/poker- (Screw holes coming through, not all the way.) fair
Mr. Do!- very good
Smurf Rescue in Gargamel's Castle- good
Space Fury- very good
Subroc- excellent
Venture- very good
Wargames- excellent
Zaxxon- good
Zenji- (Rare game. Label, slightly rippled infront, nothing major.) good

COMMADORE 64
Alphabet Zoo- (Label has plaque.) fair
Gridrunner- very good
Kids on Keys- (Has some plaque nothing major.) good
Learning With Leeper- (Label has plaque.) fair

SEGA GENESIS
Gunstar Heroes- (WOW! what a game.) excellent
Phantasy Star II- (This game is incredible!) excellent
Sonic The Hedghog 2- good
Urban Strike- very good

MATTEL INTELLIVISION
Scooby Doo's Maze Chase (NEW, rare game.)

ORIGINAL NINTENDO 8-bit
Alien Syndrome- excellent (box)
Captain Comic The Adventure- (Box is worn nothing too major.) very good, (box, manual)
Impossible Mission-II- (Box is worn, nothing major.) very good (box, manual)
Nes Satellite- (NEW-Has shelf wear, original price tag of $69.00 Canadian still on there!)
Wrath of The Black Manta- excellent (box, manual)

TURBOGRAFX CD
Ys Book I & II- (Turbo Duo CD-ROM 2, game is unopened in Cd jewel case. Used manual.)

COMMADORE VIC-20
Gorf- very good
Mole Attack- very good
Money Wars- very good
Star Battle- Rare game, label yellowing nothing major.
Visible Solar System- very good
Voodo Castle- (Label yellowing like most Vic 20 games do.) good

COMMADORE AMIGA
Deluxe Paint II (box)
Digi Paint (box, manual)
Defcon 5 (box, manual)
Sim City (box, manual)

MAGAZINES
Amazing Amiga Vol. 7, No. 9, Sept. 1992
Amiga World , Dec. 1989
Amiga Plus, Aug/Sept. 1989, Volume 1, Num. 3
Amiga World, Nov. 1987
Amiga World, Jan. 1988

MISCELLANEOUS
Pac - Man, card game, in original box. Nice collectible.

No - not even more bandwith. Pipelining is just a means to reduce the
overhead and get nearer to the theoretical maximum throughputs you listed
above.

Hi Laurence,

on Wed 17-01-2001 11:05 (-0500) Laurence Shields wrote:

A couple of years ago Laurence I was in the same situation - but *only*
used my Stfm for music - Notator SL like yourself.

>Partly because some programs don't like it (Notator SL, etc)

Yes, Notator's very picky - as you will already know ;-) and I found that
TOS with NVDI and a clean system was best (with maybe a few selected extras).

>and partly because I'm put off by the German-language oriented
>parts of it.

You can buy MagiC 6.01 in English from the System Solutions. MagiC 6.1 I
think is only available in German ATM. http://www.atari-workshop.co.uk
I find that MagiC 6.01 is a good, friendly to use multitasking system if you
would like to get into the more "computing" side of things. With 4mb
you are better to maybe go with MagiC than MiNT.

>I'm one of those freaks who like to be able to customize the look of
>everything. :)
>
Don't worry, you're *definately* not alone here ;-)

>I know next to nothing about MiNT except what most MiNT fans would call
>myths (that MiNT is hard to use and so on). Is it really harder to use than
>MagiC? Is it worth the trouble?
>
If you're mainly still interested in the music side of things stick to TOS.
Just get NVDI to speed things up.

>I have no idea what a AES is or where mine is located. NAES just makes
>matters worse. But I'd like to know, if it's not too complicated.
>
Have you checked out Mark S.Bains "Atari A-Z" book in download form? This might
help explain a few things Laurence. http://www.stsd.demon.co.uk/linnhe.html

>To sum up, I'm a musician. I have several Ataris but my main machine is a
>Mega STe w/ 4 MB, TOS 2.05 and a 48 MB hd. I use Notator SL, Logic, X-oR,
>and a few others as well as some expansion boxes (Unitor, LOG3, Export).
^^^^^^

I Never managed to get Unitor or Unitor2 - I'm envious :-)

>A lot of the info out there about MagiC/MiNT/NAES stuff seems to require some
>programming knowledge with terms like "kernel", "VDI", "scripting"...

You soon pick up these things and most things come with manuals or Hypertexts (ST-Guides) so you can work through them when you get time.

>you know, I only have so much time and music is my main passion. Not >computers.

If you don't think you'll get a chance to use MagiC, stick to what you've got - software wise.

>Sorry for such a loooong post and so many (probably stupid) questions,

No stupid questions at all, in fact I remember asking myself these a while back ;-)

>(Besides calling)
Plenty.... :-)

Get in touch with some people here that live in the dealers country, and ask them about his reputation. Also ask them for the local name of the consumer rights organisation, not that this will help ofcourse, but it's nice knowing the next time you get in touch with that dealer...
If nothing arrives in the next two weeks, send him a registered letter in his local language (people in this group can help you write it) in which you officially ask him refunding your money and mention that a copy of the letter is sent to your attorney and the local consumer organisation in his country. (if it's a German dealer you might just be lucky, the German law is very strict concerning these matters).

Next step is to use the power of internet.... being a nice guy will not get you very far, just throw his name and the facts in this newsgroup and in some of the German newsgroups as well. There are too many people that have been swindled in the past by some crooks as dealers. It's time this stops. The only way I can think of is to name the "reputable" dealers, and compile a blacklist...

The last few weeks I've got the impression that people based in the States are terrified ordering goods in Europe, it's like gambling, either you win and the package arrives, or you loose and can say goodbye to your cash...
Unless a dealer accepts credit cards or agrees to send the goods COD, tell them very politely where to stick it... if the competition can do it, then there's no reason why they shouldn't.
If the goods are sent by airmail/courier ask for the shipping number, so you can check out where exactly your package is.

Cheers from Belgium
Dennis

Hi Galen,

>This is actually why I asked. The models Olympus sells in the USA
>differ from those sold in Germany. For instance, the D-360L is a
>fairly reasonably priced entry level camera, but will it connect to the
>Atari with Photo-Tip? I have no idea.
All Olympus cameras are compatible with PhotoTip, providing the camera has
a serial port, you shouldn't encounter any problems.

Cheers from Belgium

You see, this is how you "drown your money" into Atari and get nothing.
And this is why I never order anything from those guys because I know I'll
never
receive nothing and lose a couple of hundreds of $$$. So if there is somebody
with
MagiC and Nvdi english versions please email it to me :) (I have German
versions)

Artur

Ken,
I've tried setting it with STing and it doesn't make the switch. After I switch and reboot it is still set to Serial 2... unless I'm missing something... or should I do it in both HSmodem AND STing?

Personally, from a musicians perspective, I would upgrade MagiC but wouldn't use it all that much with Notator or anything like that. I'd prefer to have the memory for use with the software instead of in the OS. As a musician, I'd stay away from MiNT for my music. There's nothing wrong with it, but I don't feel the additional features are worth the extra time and effort to set it up and buy a desktop to do musical apps...

Just my opinion... now if you were programming.. different story!

No, it's not SPAM.

I finally got something on the Falcon that worked straight away with one
of my synths. Having acquired a DX7, I downloaded DX Heaven.

And it worked.

I'm still recovering from the shock ;)

Richard

Hello,

I know Kent has been busy at work, sometimes He falls behind in answering e-mails. He's also in the middle of updating the Systems for Tomorrow website.. some of it is already online. Now the site has product images and you can order online. The bad part.. You need a Windoze or Mac to order online.

Hi Richard! Glad you like DX heaven! It is great for the DX.
Just FYI. You can download Omega KCS from my site, and you can load KCS
AND DX heaven at the same time, so you can work on sequences and sounds
at the same time. Dx heaven is an MPE module that loads right along
with KCS. KCS works great on the Falcon...so no surprises there!

of
> > space.

The address map of the ST/TT/Falcon range looks like this:

0-14M RAM
14-15M TOS
15-16M Hardware chips/ports
16-4064M TT RAM
4064-4080M VME 24bit
4080-4096M Mirror of 0-16M

(Earlier, pre-STE machines had a theoretical 15 5/8ths M limit (the cartridge port was accessed at address $00FA0000) on RAM, but could only accept up to 4 MB with their standard RAM controllers. I also have a strange recollection that the RAM chips to allow them to actually have more than 4M weren't available [or were very expensive] at the time the ST was being [hurriedly] designed)

> Not the one in the Falcon. It has a 16 bit data bus (the full 030 has
32)
> and a 24 (?) bit adress bus.

That sounds like a cut-down version of the 030 (68EC030 perhaps?)

The 020 and 030 have 'dynamic bus sizing', in which the chip can determine the bus width on every access, so can read/write in 16 bit blocks on a 16 bit system, and the full 32 bits on a 32 bit system (The 040 dropped this feature - it 'slowed the system down' IIRC)

Well, I think that it is wort the trouble.

> I have no idea what a AES is or where mine is located. NAES just makes
> matters worse. But I'd like to know, if it's not too complicated.

AES is a operating system (TOS) subsytem that operates with windows. MiNT
does not include AES, AES is started by MiNT, so you need to download and
install AES. The best AES is (IMHO) N.AES, but it is commwercial, and
needs lots of memory. (about 2MB with desktop). Free AES'es are: AES 4.1
from Atari (I think the best option), XAaes (free but still not as good as
other ones), oAesis (free but developement crawls). All of them excluding
N.AES and oAesis can be downloaded from www.freemint.de. oAesis can be
downloaded from www.nocrew.org. N.AES cannot be downloadad becouse it is
commercial.

Morover, If you need to run TOS programs under MiNT/GEM (GEM=AES+VDI) you
need to download TOSWIN2 package (www.freemint.de)

> To sum up, I'm a musician. I have several Ataris but my main machine is a

> the net with the Atari. Mainly just music stuff.

I'n very basic setup (only MiNT kernel and AES) you don't need any
programming knowledge. All you need is to download kernel (1.15.10b is
last beta and it is quite ok). After downloading you have to install it,
you have just to put correct MINTxxx.PRG to your auto folder. Correct
means - for your processor/machine, becouse there are few kernels in one
package (MINTTMP.PRG is for 68000, MINT030.PRG is for 68030, MINTMIL.PRG
is for Milan). Then you have to create MINT directory on your C:\ drive
and copy there your MINT.CNF file (it is included in kernel package), then
edit it with texteditor (MINT.CNF is well documented).

Then you hav to install AES - where you want, After this you have to
install TOSWIN2 (in N.AES you dont have to - it is included inm N.AES
package, but version from www.freemint.de is better).

After all this you should have well estabilished MiNT enviroment.

You should also download GZIP and TAR programs becouse lot of packages for
mint are compressed ith those programs.

> So should I go ahead an upgrade to MagiC 6? Or should I get into MiNT? How
> could a new AES help me?

(IMHO) You should install MiNT. How can new AES help you? Hard to say....

> Sorry for such a looooong post and so many (probably stupid) questions, but I

I find the "ESC" key seems to help sometimes.

I've gone back to the IConnect overlay now, as the need to use STinG has now
vanished. It handles off- and online browsing without hesitations or dialog
boxes.

atari@benjamin.net or atari@pacifier.com instead of NewsGroups as I
am swamped and I find it hard to keep up with reading the NewsGroups.

Wanted: Mega ST4. Willing to pay up to $100 U.S. Read on if interested!

Looking for an Atari Mega 4 ST. Please, no upgraded Mega 2's. I need a
stock 4 MB Machine Plus a TOS 1.4 upgrade would be nice. The important
feature is this. The built-in floppy must be the Chinon (I think that's
the name). You can tell, the drive has an eject button centered under
the slot of the floppy. The button is wide, short and slanted on both
the left and right side. And the case needs to be unaltered, not cut up
to replace a drive with an incompatible button. Mega 4 ST with a bad
floppy considered? As long as the case is right. Please direct your
reply through E-Mail to atari@pacifier.com or call Ben at:
(503)256-9974. I need to keep this transaction solely in the U.S.

P.S. Some have asked me "Why do you insist on a Mega 4 ST? Why not a
Mega 2 ST upgraded to 4 Megs?". My answer, I had a Mega 2 upgraded to 4
Megs. The upgrade failed and I don't want that again. I don't care if
Jack Tramiel himself upgraded it and Guaranteed it. I wan't the Mega to
come that way from the factory. I don't trust most of other peoples
tech work. I'd rather have the RAM put in at the Factory.

Once upon a time <948mj6nvg1@nnrp1.deja.com>, Tim Conrardy
<timconrardy@my-deja.com> grabbed chalk and scrawled:

>Hi Richard! Glad you like DX heaven! It is great for the DX.

You're telling me ;)

>Just FYI. You can download Omega KCS from my site, and you can load KCS
>AND DX heaven at the same time, so you can work on sequences and sounds
>at the same time.

I'm getting an internal HD, which I will set up with a minimal system
and KCS. My main shortfall is still the D50 - Genedit bombs out on
everything I've had, and is weird to work with anyway. Explorer 32
doesn't like the Falcon, and MIDIQuest costs yet I can't verify that it
will work - though the software does run, so I have no reason to believe
it won't, it didn't communicate with my D110 very well.

>Dx heaven is an MPE module that loads right along
>with KCS. KCS works great on the Falcon...so no surprises there!

Heck, DX Heaven works under Thing/MagiC. The screen is messed up, in the
usual GEM/MagiC/Thing way (Black Hole has the same problem), but it
works.

If only there was a D50 Heaven. I'll pay the shareware fees for stuff
like this... I wonder if there would be a market for retro-synth
software which is so simple.

Or is the DX7 so well known, that it was inevitable that I'd find a
working program ;)

Richard (thinks it's weird that a 1983 synth has better support than a
1987, groundbreaking and more importantly, hard to program synth)

Just one extra question; where can I find more patches in *.TX7 format,
or how can I extract them from the more common SYX format?

I like the way this program works, with each bank in one file.

Richard

Hi Steve,

>the latest ASH overlay i have is ancient although it does all the others
>can do afaics.
Indeed... I've been trying out the others also, and couldn't really see any advantage in using these. The ASH OVL accepts cookies, authentication to a server poses no problems and the POST and GET problems have been sorted out years ago... in general if a site can't be accessed with it, then the two alternative OVL's fail also. I find it to be the quickest of the three and also the most reliable one.
I never really understood why people here use the alternative OVL's in the first place, ages ago I asked for a couple of examples with which the ASH OVL has problems, but so far no one has come up with an URL....

>Whats the most recent version of the ASH overlay do you know?.
The one that can be downloaded from the ASH website ofcourse :-)

Cheers from Belgium
Dennis

You may be right, but not for the reason you've stated here. Of course
it's straightforward within IE to switch off cookies or prompt you
whenever a cookie is trying to be written.

Of course, on an Atari-based machine it's not possible for a PC to
take control of your machine via the Backdoor and I'm particularly
queasy about the deliberate inclusion of many features of W2000 and ME
to make it even easier to take control of a PC over the net.

I've never liked alternative desktops - partly because of the extra RAM they wasted and partly because I rarely saw the need to replace the built-in version with something that cost extra. I've always been amused by those who paid for the "best desktop ever" who would then immediately migrate to the next "best desktop ever". Ease always seemed to be paricularly dismal in this regard.

However, £30 is comparatively cheap for this type of product and seeing as I've got the RAM going begging I may ignore my own advice in this case B^)

Ooh, look! An Email from Mr Fernandes...

This must've just been the version of ICDPro that you were using. Both the Pro and Freeware utilities were updated to support the AHDI format and Atari host adaptor after the MegaSTe was launched, because in the vast majority of cases people only had an Atari host adaptor available to use for the internal drive, even if an ICD HA was used for the external drive.

>use SHBUF.PRG. Let me know if you want it.

As i understand it, SHBUF (Shell Bufer) allows a larger newdesk.inf file
to be used, i read this to mean that their is a limit on the number of
possible icon assignments, i think this is different from the maximum
allowable deskicon.rsc file size.

Hi Dennis

Long time no hear?, where you been.

>>the latest ASH overlay i have is ancient although it does all the
>>others can do afaics.

>Indeed... I've been trying out the others also, and couldn't really see
>any advantage in using these.

I cannot get any of them to work??.

>The ASH OVL accepts cookies, authentication to a server poses no
>problems and the POST and GET problems have been sorted out years ago...
>in general if a site can't be accessed with it, then the two alternative
>OVL's fail also.

The only site i cannot get to are using java or Javascript (whatever) and
that is not an overlay issue!.

>I find it to be the quickest of the three and also the most reliable
>one.

Agreed.

>I never really understood why people here use the alternative OVL's in
>the first place, ages ago I asked for a couple of examples with which
>the ASH OVL has problems, but so far no one has come up with an URL....

That speaks volumes. :-)

I wonder why Derryck uses anything else, Derryck??.

>>Whats the most recent version of the ASH overlay do you know?.

>The one that can be downloaded from the ASH website ofcourse :-)

The one i have here is 1.0700, this was the most recent available from
ASH that i know about, i dont know of any updates, are you guys over
there holding out on us brits?. :-)

And let's not forget Geneva. I think it would be his best option, wanting to run music software on a multitasking system with limited memory. I've used Geneva (with and without Mint), Magic, and AES 4.1, and of these, Geneva is the only one that not only is the most TOS compatible, but allows you to have a different OS setup for each program you run. For instance, I can run Cubase Audio with Geneva, and it will automatically turn multitasking off and setup the AES calls for the best compatibility. Each program can get its own individual setting for the best environment possible. I'd love to see other AES's incorporate this feature! Also, since memory is probably an issue for this guy, it doesn't need Mint to run. In fact, it is most stable and compatible without it, and uses up very little memory, while providing a great multitasking environment. If memory isn't as much of an issue, and he wants extra features (like long filenames, pre-emptive multitasking instead of cooperative, etc.) he can install a *VERY* simple Mint setup, requiring only MINTNP.PRG in the AUTO folder, and a MINT folder with just a MINT.CNF file stating which drives to have long filenames on and where the AES (Geneva) is located, then get a desktop supporting long filenames (like Thing), and a fileselector supporting long filenames, and he's all set. More advanced setups are possible, too, but that's only as necessary. There's also a free very functional demo available. It's definitely his best bet, for what he's asking (IMO, of course).
On my system, I also have a bootselector (SuperBoot 8.1) from which I can choose between a "clean" system, a more loaded up TOS 4.04, Geneva, Geneva with Mint, AES 4.1, Magic 6, ST compatibility for running some ST games (using STE-X in the Auto Folder and Backwards on the desktop), various speeds for Nemesis, etc. So he could also use something similar to choose his own setup each time he boots up. Just a thought, anyway!

Thanks for all your advice! You're right. I'd completely forgotten about Geneva. That may certainly be an option. I just need to get straight in my mind what different things do.

Where can I find easy to understand instructions regarding AES (in English)? I keep seeing it mentioned as one of my options but I've yet to find an English-language website with info about this thing. Is it a "program" in the normal sense? How can I tell what version of the AES I have in my machine now? It's not documented anywhere I can find.

Also, I see a lot of people find my memory to be quite a restriction when it comes to the choices I have. I thought that 4 MB was the MOST the STe's would hold. Is there a way around this that I don't know about? Other than buying a Falcon or TT or something because my software (and some hardware) won't work with those.

I really appreciate all the advice. This is really interesting!

1035. Zetnet and Freeserve

Newsgroup: comp.sys.atari.st
Date: 2001-01-19 19:59:37 UTC
From: neil@adel6.freeserve.co.uk
Message-ID: <94a6b9$12e$1@newsg1.svr.pol.co.uk>
Source record: 51467

Two questions regarding these two UK ISPs:

1) Has anyone else having difficulty in getting anywhere with Freeserve? I get connected, or seem to, and then as soon as I check mail or Connect to newserver or try a web address the dialog boxes in Newsie & CAB report "Resolving host"!! Sometimes I am lucky and get in properly, is it due to high numbers of folk logging in to Freeserve? Or is there some fault with my software etc??

2) In light of the above problem I looking at taking out a subscription to Zetnet but was confused by the number of subscription options available on the website, esp. for Mail servers etc. Does anyone connected to this server have any recommendations? I was hoping to subscribe to the cheaper service, ie 50UKP a year and no web-hosting.

I currently use an Atari Falcon CT2B - Magic 6.1, STiNG 1.22, Newsie 0.96, Cab 2.7c (+ Olivier's CAB.OVL).

Any suggestions would be appreciated!

They do include the cables, but not the face plates to mount them
on, I ended up yanking these from scrap PC cards. I mounted
some of them on the case, but was forced to find the face plates
for the remaining ones.

Speaking of cables, the only one not inlcuded was the SCSI
cable to get it out the back, as needed to hook up a SCSI scanner.
Anyone in the USA know where to get such a thing? I've tried
all the local shops with no success.

Go to the Atari-Midi File Section,(see sig.. .atari-midi mailing list)
and there is a file there that has LOTS of banks in TX7 format. Look
under DX.

I believe that MT32Edit on the Caged Artist page (on my site)should
work with your D110 as it is the same structure. Try it.

GenEdit is kinda weird to work with as you stated.

Hi Celery dude

>Ease always seemed to be paricularly dismal in this regard.

You looking at me!!!???..... :-)

I bought Ease in a bundle with Magic, and then promptly dumped it in favour of MAGXdesk, i toyed with Thing for a while and decided it was shitte, then i saw a very early Jinnee demo on one of my numerous visits to uncle Karls emporium of computer goodies, i then pestered them on a regular basis for many months, i bought the first available commercial version 1.?? and have followed its progress since, now i wouldnt part with it.

I would like the widow update function to speed up a /lot/, and would like to be able to use MGCOPY in favour of Kobold or JinCopy as file copying is dog slow..

>Go to the Atari-Midi File Section,(see sig.. .atari-midi mailing list)
>and there is a file there that has LOTS of banks in TX7 format. Look
>under DX.

DumpIT - from your own archive - has no problems - I'd misunderstood the
SYX archives as containing one huge file, instead of hundreds of little
ones ;)

>I believe that MT32Edit on the Caged Artist page (on my site)should
>work with your D110 as it is the same structure. Try it.

I have D110 edit, which is a caged artist thing. The D110 isn't the
problem, as it's dead anyway - the problem is my D50!

Regardless, I'm gradually getting there. MEDIAN appears to work, if not
do a hell of a lot else, and I've hooked up a MIDI/CV convertor to my
101 and am trying to find a way of multi-tracking some MIDI stuff using
Omega. Which doesn't seem to like Falcon screen modes, sadly, because it
could use a much larger screen ;)

>GenEdit is kinda weird to work with as you stated.

Weird would be an improvement. The D50 template has always bombed out on
me.

Hi

I've realised that there were quite a lot of people here inquiring
about what scanner/printer/HD etc work with Ataris. I'm going to
design a part for my web site for just that, split into section of:

Scanners
Injet Printers
Laser Printers
Hard drives IDE (including remopable)
Hard drives SCSI (ditto as above)
PC Mice (for Mouseburster)
Modems (56K and other ones like ISDN)
CD/CDR/CDRW (most will be copied from Anodyne, and other
sites when I ask if it's OK first)

If any one else whats other hardware listed (or if I forgot something
obvious) then just email me and I'll add it.

Questions:

Make
Model
Basic spec (size of HD, DPI for printers etc)
Software used to drive it
Which Atari/Clone
Problems/Querks (if any)

Again email me if you think another column is needed.

But most of all, to make this work, I need your HELP
Email me with results for all your hardware at
bindon@madasafish.com

There are special programs/drives that will do that. A friend of mine had
one and it worked fine. It backed alot of commercial programs that could be
used if something happend to the originals. I am sure these programs are
available from retailers.

|service, ie 50UKP a year and no web-hosting.

I have just signed up for their 0800 service - one thing that
strikes me is that logging on takes less time and is more reliable.
It comes with the 100UKP option, however, and you have to either
send money or credit card details so that when your time limit is up
they can get money from you.

True but for it's size it's very sophisticated and lets not forget it's an
old program that was Y2K in 1991!!

That name rings a bell from a few years ago.

"PFM" = "Personal Finance Manager" ?

So, what does it do?

Is it worth me building file/feature compatibility into my stock
manager/invoice program I've nearly finished writing?

A demo pre-alpha version of my app should be available near the end of
this month, or early next - I still have another five or ten thousand
lines of it left to write. The executable is currently around 300k in
size, it needs about one meg of RAM (the full, finished version looks
like it may need about 2 - 2.5 MB if you're using GDOS, and the SLM
laser printer), a 68000 or better processor, and a 640-wide screen mode
or better. (I still have to make the program a bit more
printer-friendly, and a few other features need tidying up) ATPIT, there
isn't a user manual - it'll probably be a readme.

--

Quote for the month:

"Geez Wayne!"
("A Week Of It", SPTV, circa 1980)

Source record: 51426

Hi Neil

>1) Has anyone else having difficulty in getting anywhere with Freeserve?

Now there's a story...

>I get connected, or seem to, and then as soon as I check mail or Connect
>to newserver or try a web address the dialog boxes in Newsie & CAB
>report "Resolving host"!!

I had to give up on freeserve quite some time ago due to this problem.
They "Introduced new security measures" this included some kind of
dynamic web-cache which caused CAB to flop, then they beefed up security
on the POP server which barfed all over iConnect, i think it was reverse
IP checking and VJ-compression was jammed on...

I then went to BUN.COM where is was for eons with no prob's, and when i
got Sky digital installed i discovered SkyNow.

SkyNow seems to stop working with some mail server problems, this
resulted in error messages from emailer telling me my key had expired,
this was total bolox of course, after a few days i phoned tech-sup, they
investigated and said they would fix their server, 3 days later i phoned
back to find out on progress and was told that as far as their system is
concerned, they have no problems and there is no record of any fault
reports!!. The latest failure is BUN.COM, having just took over from
WorldsOnline they inherited their crap servers and news just was not
propogating, very usefull.

The latest, MadasaFish, still working so far, but with frequent POP3
probs, and the Madasafish user bases full of peop's talking of same and
being ignored by tech-Sup, but at least it works ATM...

Maybe if Mr. Denesh CyberStrider is watching he could give some details
of what his ï¿½10'rs would give Atarians as far as eMail and News is
concerned.

Since you have a HD and a CD already, I assume you have a SCSI adapter already. Hence, you need a SCSI CDR or CDRW and either CDWriter, CD Lab, or a program from Soundpool whose name escapes me. CD Lab is free, the others are both ~$85US but have more features. In theory, any MMC3 CDR drive should work, but in practice, Yamaha seems to be the most compatible. On a ST, only 1x burning is possible most of the time, so I'd recommend looking for closeouts.

As for myself, I use CDWriter with a Panasonic 4x8 (model CW7502). Reads are fine as are backups, but at the moment ISO9660 recording is a bit shaky and audio recording doesn't yet work (though the author is working on it). Those who have Yamaha drives find that CDWriter works flawlessly, so it's a firmware, not a software issue.

Very few accept credit cards. Doing so would help immensely, for most
US banks are clueless when it comes to exchanging currencies. Only the
very largest will, and 15% seems to be the going rate for the service.
The few times I ordered software from Great Britain and Canada via
credit cards, the exchange fee was 1%.

Ok.. I have an idea.. but it needs work.

here goes..

Set up a list of European users willing to purchase software and ship
it to fellow users around the world.
Example..
When we need something here is the USA.. send an e-mail to one of the
European members. They contact the Dealer and get a price quote and e-
mail it to the USA member.

Now for the payment "issue" .. I can only think of Paypal as a good
way of paying fast and safely(?).. other than that.. Traveler checks.
But if it's Paypal (www.paypal.com).. the USA member will send at least
1/2 (Maybe setup a User rating system and base the PRE-payment on
that?) of the purchase price + shipping. Then the European member
purchases the items and ships them with a shipping company that offers
Tracking the the USA member. If a balance is owed that will be payed on
arrival.

Why Paypal.com? International system, also screens users (valid credit
card required). Bad part.. requires SSL and maybe Java.. so Cab is out.
Paypal charges a small fee for each transaction.

For a Shipping system.. it MUST have a tracking system.. and if possible.. can be tracked using a web site. (like www.UPS.Com)

For protection of members/users .. a rating system which will help base a "pre-payment" amount. 50% fair to start? Maybe on the idea of ebay.com's user comments also?

a SMALL standard fee? To help cover the cost of calling the dealer, Paypal transaction fee, Member time.. etc...

ok.. that was kind of long.. but what do you think about it?
The one question I have..

I'd host the service on my domain.. so web space is no problem.

Just my 2 cents..

Rob

Well, I work for the post office, and I can say that I mailed a monitor 700 miles by priority mail once, which should have taken 3 or 4 days, but it arrived 30 days later. I mailed an STE about the same distance, and it never arrived. Luckily I insured it, so I got my money back. The bad sign is that this "reputable" dealer has not responded to you. You might go to your post office to inquire about filing a complaint with the postal inspectors for mail order fraud, assuming you sent payment in the mail. Why not call? It always pays to expedite your communications before making a big flap over it.

If we're talking an international order, my estimates vary. The US Postal Service web site quotes 4-6 weeks for surface mail, but I've seen 2 to 3 months, or even 4 as being more realistic. Air mail can be one to two weeks, sometimes more. I've had trouble with things mailed to europe being stuck in customs for a month or more.

Geneva seems to often be overlooked, but I think it's a great alternative to Magic or NAES, especially for those of us in the U.S. who find it more difficult to get NAES and other software not distributed to this side of the pond.

> Where can I find easy to understand instructions regarding AES (in English)?

> English-language website with info about this thing. Is it a "program" in
> the normal sense? How can I tell what version of the AES I have in my
> machine now? It's not documented anywhere I can find.

I believe you're referring to AES as is specifically AES 4.0 and 4.1 as made by Atari. As far as I know, there is no website for it, but it's what many people call "MultiTOS". It's basically a rewrite of GEM that runs on Mint. AES 4.0 was distributed by Atari with Falcons, and AES 4.1 was the beta version that as far as I know was never officially released, but turned up on many FTP sites. It's a little buggy, but a lot faster than the original MultiTOS. It's a program, but must be run from a MINT.CNF file to work, and instead of having a *.PRG extension, it's called GEM.SYS.

AES in general is basically the part of the OS that controls graphical events such as windows, menus, dialog boxes, etc. It is in a way a standard against which newer OS's define compatibility. Things said to be AES 4.1 compatible may not run on standard TOS, Geneva (which has most of AES 4.1's calls, but registers itself as 4.0), or Magic (registers itself as 3.99). To find out which version you have, get a system analyser program like Profiler.

> Also, I see a lot of people find my memory to be quite a restriction when it
> comes to the choices I have. I thought that 4 MB was the MOST the STe's
> would hold. Is there a way around this that I don't know about? Other than
> buying a Falcon or TT or something because my software (and some hardware)
> won't work with those.

Many people see 4Mb as small because many of us are pushing the limits with AUTO programs, CPX's, Accesories, and multiple programs running at the same time. This is *really* tough to do with a 4Mb system, especially since newer OS's are taking up more and more memory lately. You may be just fine with 4Mb, unless you decide to go wild with various programs and features that

can be added to the OS.

Good luck!

4mb is the official limit. An Aixit (I may of spelt that wrong!) can
give you about 14 or so maximum ram. From what I've heard they seem
to be stable and work well.

Hi folks

Just to say that I'm connected right now via Freeserve. If you give
me a shout I can give you a URL for a script for use with STIK/STing
that works fine with Freeserve. I can give you Freeserve's phone
number in the UK if you wanted to set up an account. They currently
have something called Hometime which gives you unmetred access after
6 pm weekdays and all weekend for 8.99 ukp (5 ukp to BT for Surf
Together and 3.99 to Freeserve).

Give me a shout?
Al

I cannot find a separate IConnect V1.8 package in the CAB download area. There is the commercial PPP_Connect v1.8 but this does not seem to contain any *.OVL.

I was interested to read in a previous contribution that ASH had sorted out various .OVL problems "years ago." I bought CAB v2.7 not that long ago and was advised that I had to get CAB.OVL from third parties.

If ASH now have a working .OVL (something that should have been included in CAB from the very beginning) the least they could do is advertise the fact to their customers and allow them to download it for free.

That's one that was not included actually. I bought SCSI flat cable and connectors and a SCSI backplate and made my own. I used a vice to clamp the connector onto the cable - you need to take a little care to get everything square but it's not difficult.

Indeed, in case anyone didn't see my original message I've just uploaded the
Novascan 1.26 driver package (Misc section). This should now work with the
Falcon.

I've removed the Novascan resource file I had originally, as this full
package makes that download superfluous.

I know Maplin sell SCSI faceplates with various configurations to go
from internal to external. Maplin is UK based, but I'm sure someone
sells them in the USA.

>server have any recommendations?

I'm with Zetnet, and have just signed up for my 3rd year. The web site is *slightly* out of date. They restructured their account types a year ago and didn't alter the main pages. Instead, a temporary page was put up at www.zetnet.co.uk/accountchanges.

With the standard account (100UKP/year) you get 100MB webspace, unlimited email address etc. etc., unlimited 0845 access, also 0800 access limited to 10 hours per month (after that they charge you local rates).

With the other 2 accounts, you don't get the 0800 access, and the hours during the day that you connect are limited with the free account.

For Atari use, you just need to specify that you want POP3 mail and the Atari setup disk, not the Zimacs package for PCs.

They supply all software necessary for getting Atari's up and running on the net, but you're best advised to get the commercial version of CAB and upgrade to Sting instead of Stik.

I don't actually find the account types or mail types confusing! Is there anything specific you want to know?

Ooh, also you can sign up for the filtered news server or the unfiltered one.

Sorry, I see you already have the right software!

Also, Zetnet are a friendly lot. They have their own local newsgroups
and you'll often find the directors and techie people joining in the
threads. We often have meets at various places, and yes sometimes the
Zetgods come along too! They also have their own Atari mailing list
and an Atari newsgroup.

That is very good, but I hope there will be support for the maching. I hope also to view the stats of the maching and make sure it has what it should before I decided whether or not to buy it.

You are absolutely correct. Geneva, as far as compatibility is concerned,
is alot better than Magic or N.AES. I use all 3 and I prefer Magic, but
some things I use do not work under Magic, but do under Geneva (ie
Photoline, HD Sentry).

Hi Derruck,

At first try for the Interface package, not your translation, I get a block,
possibly because the site uses Java??

Will keep on trying. I have an earlier version of Interface and it is a superb
package.

Every decent ftp-server which has an Atari section holds these things.

try this one:

ftp://chapelie.rma.ac.be/atari/archivers/

Go for lharc310.zip which I believe holds a GEM front-end for lharc.ttp

HTH,
Martin

A small correction. Geneva is maybe far more compatibel then MagiC but
certainly not more then freeMiNT/N_AES. Photoline and so on runs very
happy with freeMiNT/N_AES. Even Cubase works with N_AES.

Hi there!

Have people forgotten the old reliable TrueImage from HiSoft? This has a dedicated 'colourise' tool for greyscale images. Choose a colour and 'paint' over the greyscale image and it will alter the tint.

Most of HiSofts products are available really cheaply from themelves, so it might be worth checking out:
http://www.hisoft.co.uk

Cheers,

Jerry

>standard Atari. There s a 1 Gb Toshiba IDE drive inside, i got a VGA
>adapter, a great Agiler mouse and THREE trackballs with it! All this for 160
>Euro!
>
>QUESTION 1. Does anybody know the brand or any other info about this Falcon
>upgrade kit? Could be Dutch or German i think. (Bought it in Holland)

Does this case replace the standard top half of the plastic Falcon case,
but retains the bottom half? And is it approximately 47.5cm in width, 29cm
in depth, and (from the desk surface) 12.5cm in height?

If the answer is yes to both, then I think it's likely that the case is a
DeskTopper case. My Falcon is housed in one too, though I don't have LEDs
on the front there are a couple of holes that aren't used on mine (also
there is a keyboard connector, reset button and on-off switch on the
front). All the standard connections are still there around the back plus
another keyboard and the joystick connectors.

I'm not sure who manufactured these cases, but they are really nice and
roomy with space inside for harddrives, CD Roms etc etc!

Various cable configurations give options for example you can have an
extra power out socket on the case for powering a monitor from the one
power plug (assuming your Falcon power supply has been upgraded of
course!) but mine's not connected.

Cheers!

James

I would agree if the non-fpu/pmmu version was being used. But when this new core is being used, it gets interesting. Could you tell me what is nonsense? The usage of this coldfire, or do you mean the whole thing is a lie? Would a clone using 4e CF be nonsense, you think?

Hi Ji

>I cannot find a separate IConnect V1.8 package in the CAB download
>area. There is the commercial PPP_Connect v1.8

They are one and the same, and it is a full free download

>but this does not seem to contain any *.OVL.

It doesnt, and it wouldnt, its CAB that needs this and would be included
with same.

>I was interested to read in a previous contribution that ASH had sorted
>out various .OVL problems "years ago." I bought CAB v2.7 not that long
>ago and was advised that I had to get CAB.OVL from third parties.

That would be valid advice if you indicated that you didnt have
PPPconnect at that time.

>If ASH now have a working .OVL (something that should have been
>included in CAB from the very beginning) the least they could do is
>advertise the fact to their customers and allow them to download it for
>free.

They did, by including it in your installation disk.
Ive just checked my CAB 2.7 installation disk and it does contain the
OVL, as well as the JPEG_OVL, perhaps you elected not to install them.
Try a re-install and check the PPP connect button!.

http://www.application-systems.de/cab/download.html

Here's the URL for the ASH site where you can find PPPconnect, i advise
you to install this and the ASH overlay from the CAB 2.7 master disk,
you'l be glad you did.

N.B. you'd need a PPP compatible eMail/news client unless youre happy
getting mail and news seperately.

1114. Epson colour stylus and NVDI 5

Newsgroup: comp.sys.atari.st
Date: 2001-01-21 03:40:44 UTC
From: Ken Macdonald <anarkist@idirect.com>
Message-ID: <3A6A5A4B.916D041D@idirect.com>
Source record: 51445

hi
I am getting some strange output on my Epson Colour STylus 640.
I am printing from Atari Works, using NVDI 5.03, to the Epson.
It looks like all the higher end characters(accents, etc) are printing
instead of regular text. NVDI 5.03 works fine printing to the HP500
deskjet, I wanted the higher quality available on the Epson though!
also:
When I use the NVDI 5.03 control panel(drucker) when I change the
printer from HP500 to Epson640, the control panel(xcontrol.acc,
zcontrol.acc, or cops.acc) the control panel crashes.

I have tried re-installing NVDI 5.03 but it doesn't change things.
I have tried this under TOS, Magic5, and n.aes2/mint1.15 with the same
results. I have the printer port on my CT2Falcon going to a switch box,
from where I can choose the HP500 or the Epson640.

can anyone offer any clues as to what could be the problem?
ken

1115. nvdi5 printmon ??

Newsgroup: comp.sys.atari.st
Date: 2001-01-21 04:04:09 UTC
From: Ken Macdonald <anarkist@idirect.com>
Message-ID: <3A6A5FC9.6C1BCEB9@idirect.com>
Source record: 51347

salut
is there anyway that i can disable the printmon that starts up when
using nvdi5? When I try to print in TOS, Printmon always fails, and
nothing can be printed!!
I tried renaming printmon.app to printmon.apx, but no go.

printing under TOS(CT2 turned off) and Magic5, nvdi5, shows a message
that print monitor is printing "unbenannt" (?) and it is gibberish.
30 sheets either blank paper or one line of accents and print monitor is
stuck at 33% of the print job and won't move any further.

I guess the Epson640 driver is bad?
I don't have an Epson driver as such, I have an
ESC2.sys, 50 692, 20/1/01
ESCP2.inf, 44 916, 3/8/90
DJ_500C.sys, 68 761, 14/4/94
NVDIDRV1.sys, 3 071, 26/6/98 ; what are these??
NVDIDRV2.sys, 3 332, 26/6/98
NVDIDRV4.sys, 3 354, 26/6/98
NVDIDRV8.sys, 1 608, 26/6/98

thanks for any help
ken

> how to get my hard drive back so i can delete said acc.
> Thank You.

When your atari starts to boot, hit ALT-A. Hopefully your atari
bypasses the HD boot and defaults to drive A. From there, hopefully you
have a disc (backup) with the AHDI-604.prg (or simlilear HD booting
prg) Start the program and hit ALT-C. That should get you back to your
C drive. Then DELETE the $#$@#$ ACC that is causing the problem. Then
get MOUSE BOOT or another Auto/ACC manager and you won't have that
problem again!

This method has saved my skin many times. One tome i put the program
TWELVE (by stienberg) in the Auto folder hoping to boot it on startup.
What a mistake that was!!! Bruce from B&C Computer visons showed me the
above method.

Well, there is a port for MiNT. It is a part of SpareMiNT distribution, so
it will need many other packages (ncurses). Everything you need can be
downloaded from SpareMiNT page (I do not remember url). Check
www.freemind.de - distributions.

Nice little card that gives you more RAM, made in Germany if memory serves me right. Looking at the review right now, and TOS 2.06 or Magic 5.11 is needed. Go to http://www.aixit.com (Ah, I did spell it right the first time around!) You may like to ask Derryck Croker as he wrote the review so I suppose he has it.

It works fine for me, but recently in the last month I get problems
resolving host. Seems to me if I leave it for more than 30 seconds
with out sending a packet of data Madasafish stops replying to my
requests. This is all by looking at the RD and SD leds on the modem
though. Tech support last time I enquired was extremely good, about 4
months ago.

Message-ID: <fjcx+MCvtua6EwBm@lovecraft.demon.co.uk>
Source record: 51362

Wonderful.

I got my new internal HD, and installed it.
Now something has happened to MagiC - Booter on the SCSI drive, which is causing the Falcon to either lock up or display garbage when I choose to boot from that drive. When I got it, the internal HD had a system on it that the Atari booted first (though having formatted and partitioned the drive, now it won't boot from it even when the SCSI isn't connected, making it clear that my idea of having one clean system and one MagiC system by connecting a SCSI device isn't going to happen).

Is this a known problem? Do I have to install MagiC from scratch on the internal drive? Why is this machine so utterly unreliable, even though I finally got DX7 software that works, running KCS Omega and the /supposedly/ matched Caged Artist editor DX Heaven under MPE causes corrupted screen displays, and don't even touch the stuff that allegedly works with Roland kit.

sighs All I want it a simple MIDI sequencer that works like TigerCub but better, and editor/librarians for my synths that work, and the whole lot being usable. This is supposed to be the Atari's strong point. I lost all enthusiasm for it being an 'Atari' a long time ago. I can't even describe the problems with the disks in a meaningful way, because I have no idea what it's actually doing - as far as I can tell, even if I boot from a Syquest, it's really reading a boot sector from the SCSI drive and HD-Driver is merely reading auto and inf files from the other drive - especially since the accessories and other stuff are still loaded from C. In that respect, the internal drive does nothing to help me other than add space. I like the way the system works under MagiC and Thing, when it works, it's good for file management and it looks nice.

I found out why the speaker wasn't working. It's broken. Whoever fitted the RAM upgrade opened the case too far and pulled the white plastic terminal block back, tearing the thin copper wire from the cone.

All the problems with the software, plus the lack of sensible MIDI expansion for more channels, and the fact that I simply don't need to to audio recording, have lead me to one solution:

I'll swap my system for a TT system of similar spec (700Mb (215int, 500 ext) of storage, CD drive and Syquest, VGA monitor (a monitor capable of displaying a high resolution with lots of colours, or Mono), 14Mb RAM, FPU.

Or a MegaSTE plus cash.

The final option is becoming more attractive - a PC, with a couple of MIDI interfaces and nothing else.

Any ideas for fixing this lame MagiC OS would be welcome. Upgrading to 6, no matter how much better it is, will /never/ happen as long as I'm convinced that whoever wrote it should have perhaps actually used it for what Ataris have always been used for before releasing it.

Richard

That may be true for you, not for me. Photoline does not run under
Mint/N.AES for me, but I would imaging that I do not have things setup
correctly. I can say that about 99% of the programs I have tried run under
Geneva.

I wouldn't want to appear to put a dampener on things but surely, with the level of support that is likely to be out there, wouldn't we be better encouraging people like the STeem programmers to develop emulation so that we can still use our favourite APP's and the like. I can't read German so don't know too much about the new machine but for the price (about £500-£600 sterling) you could get quite a good spec PC then stick nothing on it but a good emulator.

Just a thought.

Chris Thorley.

Message-ID: <1103_980104435@garfield>
Source record: 51369

I'm digging out some of my old ST software to use with GEMulator. I find that GEMulator is more reliable when I set it up to use a virtual
hard disk instead of accessing my Windows drives directly.

The problem I am having is that if I use a virtual hard disk I cannot access the Windows drives and file folders at all. I would really like
to be able to access both. I have some files on PD software CDs that I would like to transfer to the virtual hard drive, but I cannot see
both the CD and the virtual hard drive at the same time. I also have no easy way to copy a file I have downloaded with my PC to the
Atari's virtual hard drive. Right now I'm copying stuff to a floppy, but this is slow.

Does anyone know of a good way to transfer files into an Atari virtual hard disk? Should I just stick with the Windows file system
instead?

Thanks,
-- Paul

Because a AGP-Bridge has the same register-level API.

AGP and PCI are very similar (many graphics chips support both with minor
sifferences in external connections), nevertheless AGP is not a PCI variant,
since it is not standardized by the PCI SIG.

Hi Derryck,

DC>Indeed, in case anyone didn't see my original message I've just
DC>uploaded the Novascan 1.26 driver package (Misc section). This should
DC>now work with the Falcon.
I had some problems with the 1.26 (I don't remember exactly) so I
downdated to the 1.25 after some German Atari users had recommended
to do so.

So try the 1.26. If it works correctly, ok. If not let me know.

Hi all,

Just to confuse the issue, Photoline as you know comes in two flavours, one for
FPU and for non-FPU. The FPU version runs happily on my Falcon (with FPU) for
both TOS, Geneva and Magic, whilst I have to run the vanila version on my 68040
Milan under both MINT and Magic.

The 040 and 060 is not 68882-compatible, as it only supports a subset of
the 882 instructions. You need a 882-emulator, Motorola supplies one which
you should get when you bought the Milan.

Btw. Photoline works fine with N.AES 1.2 on my Falcon/Afterburner/Nova. I
haven't tested it under N.AES 2.0, or my Eclipse. The FPU version doesn't
have any problems with the 882-emulator on my AB.

I'm not saying that emulators are in and of themselves a bad idea, but YUCK! Limitting yourself to one would really stink! I've admittedly not used any of the most recent PC Atari emulators, but I've used Atari emulators on Mac's and PC's, and they just can't seem to beat my true Atari (Falcon) for flexibility, graphics, as I can't seem to get many of them past that ST-mode-only hurdle (I can't stand 640x400 or lower and only 16 colors or less after experiencing 1024x768x256 colors on my Falcon), and the pure joy of knowing that you're actually using the real mccoy (for what that's worth). I just need to throw in a good PPC and I'm all set! :)

Hello Richard,

i know the Falcon is a troublesome bird sometimes, but not worth being so desperate about...
I just bought a Falcon with an internal 1 Mb IDE drive to which i connected my external 2 Gb SCSI drive. Both 4 partitions, so CDEF on the IDE and GHIJ on the SCSI. I installed Magic6 on the C partition of the IDE drive as well as NVDI5 and the rest. I copied all my software from the SCSI to the IDE drive so that i can use the entire SCSI for audio. The system boots from C, i use a bootmanager, the ancient deskmanager, to choose my boot setup. Oh yeah, i installed HDdriver 7.8 on both the IDE and the SCSI.
No matter if i boot with clean TOS, TOS with NVDI and extra gadgets, or Magic with gadgets, the system recognizes all partitions. Magic is a bit unstable, but i�m waiting for an 68882 FPU i bought on the net. I�ve got one in my other(stock) Falcon, it makes a difference in terms of stability and speed. For music apps, which are mostly old and use direct hardware access, and thus dont�t work under Magic, i boot up with clean TOS.
I still use the Falcon mainly for music/midi/HD recording because it still gets the job done, opposed to my 350 Mhz IBM PC! So don�t give up too easily!

Hi

I've just figured out how to use Centscreen under Magic, which I eventualy remebered an article about it in AC. I'm using a Multisync Microvitec monitor (series 13) and with the correct *.dat file renamed to video.dat. I also have 25Mhz bus and 50Mhz DSP.

I have a problem and I'm not sure what's causing it. if I'm in a high resolution in turbo mode, ie 1024*768*16 the screen goes black if I don't touch the mouse for more than a couple of seconds. The two screen savers are disabled. Is this some protection feature in my Monitor?

Also how do I know what the screen refresh rates are? I don't want to hurt my eyes, does the accelerator help?

TIA (currently in VGA to save my eyes!)

Hi,

I know what you mean and simpathise (or something like that) with you.

The Falcon is a strange beast when compared to it's older brothers.
Very difficult to set up but superb when running right.

I got mine in December last year and still haven't quite got it right.

I bought it as a stock 1mb machine, had 4mb fitted (now upgraded to 14mb. I
fitted a hard disc 3.2gb (C,D,E and F) using HDdriver 7 and my latest
addition is a 68882 FPU as stolen from a Apple laptop bought from Bowlers
computer market in Manchester for £5.

I also soldered in a VGA port to use on my monitor.

All well and good being able to do this but the software support for this
machine seems to be dire. I have already got a copy of the software that I
need as I used to use a 4mb STe and a 4mb Mega ST and to say that this
machine is supposed to be highly compatible would make me laugh.

When you have got the right versions of the software and finally got through
the mess of getting it working it is a truly wonderfull machine though.

1145. TosBox 1.10 and NVDI 3.0

Newsgroup: comp.sys.atari.st

From: Robert Cy Jones <cy@cassini.demon.co.uk>
Message-ID: <3A6B6C7E.DD4D4A60@cassini.demon.co.uk>
Source record: 51379

Hi I'm emulating my old Atari on my PC :(via TosBox 1.10

I can get NVDI 3.0 to run, but it only deals with the fonts and not the
screen resolutions. I can get it to run at 1280 x 1024 in 16 colours but

not the higher colours 256 etc that my TT used to have.

NVDI is configered for my old ET400 card, my PC has an STB Velocity.

Any ideas?

>Programs which don't understand LFNs are kept happy that way.

Yes I knew that, but that doesn't answer the question I asked. How do
LFN partitions differ physically - do they have a different directory
structure for these long names or what? And how does the 'Temporary' bit
of VFATCONF work? If you switch it on temporarily to save files and then
switch it off again, are the LFNs still there when you switch it on
again temporarily with VFATCONF? If so, presumably only if you haven't
edited and resaved them in the meantime - or...?

Regards, /Peter/

>external drive.

Hi Harry!

Possibly, though I /thought/ I had the latest. Mine came with Link 2
(with V5.13 of hdutil.prg and V6.5.5 of icdboot.prg) and the PRO had
V5.08 and V6.2.0 respectively). Also had the older ADSCSI versions.

~~~~~~~~~~~~~~

Regarding Steve's later posting re. ICD Pro, I can't reply to it there
as CixRead crashes as I try and save my reply, so I attach it here:

In message <979927362-886797AEicMi@madasafish.com>,
steve_sweet@madasafish.com said:

>The other way around dude. ICD Pro. will work with any adaptor.

Hi Steve!

I had an idea that was the case, that's why I put in the qualifier.
BUT I find that ICD PRO's ICDBOOT v6.2.2 will not work with my Falcon!
HDUTIL.PRG reports "ICD Host Adapter or ICDBOOT required!" and when I
run ICDBOOT.PRG it reports the SyQuest on the SCSI bus "ID9 SyQuest"
but then goes on to "ID15 ** UNRECOGNISED UNIT **" and hangs, so I
have to reboot. This is presumably the Falcon itself (SCSI 7). Doesn't
get as far as the internal IDE... This is with both HDDRIVER active
and disabled - I renamed HDDRIVER.SYS to SY8 and booted off floppy
with ICDBOOT.PRG in A:\AUTO\ with the same results as running it when
HDDRIVER was loaded.

Regards to you both, /Peter/

Dirty old dog! :-)

>like to be able to use MGCOPY in favour of Kobold or JinCopy as file
>copying is dog slow..

Really? I find Kobold very fast, except with LFN partitions where it
works via GemDOS (only available from V3.5 onwards). But then so does
MGCOPY, I would have thought. I've never been able to get it to run.
An entry appears in the APPLINE bar, but nothing else happens AFAICS.
But if you really want to use it, why not rename MGCOPY.APP to
KOBOLD.PRG and jinnee should use it :-)

Regards, /Peter/

Emulator's are too limited in there device support and speed. My CT2 Falcon
Blow's the sock's of my K6-450's winston setup. The FPU under emulation is
Shite. My main Pc only report's 25 of a BOG Falcon with 16Mhz FPU, let alon
the 50Mhz one under the hood of the CT2. Beside's PC's suck. I get sick of
using them at work (mostly because I fix them all day). I enjoy my Atari's,
as for playing old games I have 3 STFM's, all the old prog's work 100%
without pissing around with emulator's.

Once upon a time <94fkdiobb1@azure.nl.gxn.net>, Freek Munniksma
<freek@munniksma.myweb.nl> grabbed chalk and scrawled:

laughs I'm just getting so annoyed with this machine, but
desperation... hmmm... not quite yet.
Almost.

>I just bought a Falcon with an internal 1 Mb IDE drive to which i connected
>my external 2 Gb SCSI drive. Both 4 partitions, so CDEF on the IDE and GHIJ
>on the SCSI. I installed Magic6 on the C partition of the IDE drive as well
>as NVDI5 and the rest.

Is MagiC 6 an improvement on MagiC 5? I'm sure it's something like ï¿½99
here, which is a silly amount for such a bug-ridden program.

The problem (amongst the other random problems) that I'm having is that
the Atari would appear to be upset about me booting from the external
drive which currently has CDEF on it.

Here's my setup:

540Mb Seagate - CDEF.
44Mb SyQuest - GH
215Mb Internal IDE - I
Zip Drive - J
CD-ROM - drive P, because that's what Extendos tells it to be.

Drive C has MagiC. Drive G I insert various carts into, but is basically
TOS - or should be. Inevitably I get a nice mess, thanks to HDDriver's
boot manager being good, but not smart enough to redirect /all/ boot
operations to the required drive.

Now, in the interests of trying to fix the damn thing, I installed
HDDriver and MagiC, nothing else, on I.

Rebooting, it appeared to boot from Drive I, showed 4 drives, but only
one appeared on the desktop. When I 'install devices', C drive becomes
empty, i.e. the poor thing doesn't know if Partition C, SCSI ID0 is C,
or I: is really C:.

Now, I think MagiC is expecting the IDE drive to be the boot disk, even
though there is /nothing/ on there, and as such, gets upset. I've tried
re-installing MagiC on C, with no change - garbage as soon as the
MagXBoot program has run, either instantly or after it's locked up and
I've reset.

I assume I have to instal my OS on the internal drive?

>I copied all my software from the SCSI to the IDE
>drive so that i can use the entire SCSI for audio. The system boots from C,
>i use a bootmanager, the ancient deskmanager, to choose my boot setup. Oh
>yeah, i installed HDdriver 7.8 on both the IDE and the SCSI.

frowns How does that work?
You're not in Scotland anytime soon are you? *grins* Fancy making a
Falcon behave?

>No matter if i boot with clean TOS, TOS with NVDI and extra gadgets, or
>Magic with gadgets, the system recognizes all partitions.

Hmmmm. I need this boot manager. I haven't seen it on any of my CDs. Is
it Falcon-specific?

>Iï¿½ve got one
>in my other(stock) Falcon, it makes a difference in terms of stability and
>speed.

I have a 16MHz 68882 in my machine. The first upgrade I fitted.

>I still use the Falcon mainly for music/midi/HD recording because it still
>gets the job done, opposed to my 350 Mhz IBM PC! So donï¿½t give up too
>easily!

My biggest problem with it is the age of the music software, and of
course, the lack of extra MIDI ports on the Falcon. I keep reading about
Cakewalk utilities, librarians and such, for my ancient synths, and
trying 'equivalent' software for the Atari and discovering it simply
/doesn't/ work. GEN Edit is a good example, that failed to work on my
STE, so I thought 'Oh, perhaps it needs something better', and got the
Falcon. It has templates for most older synths, like the dreaded D50.

It just crashes. No matter what you do. *shrugs*

MIDIQuest, a 'modern' program, is available as a demo which ran, but
wouldn't talk to my D110 (the only template I had I could test it with).

And as for SoftJee's demos. Well, for once it's a Falcon program, using
real Falcon graphics (like the ECC stuff, which /does/ work thankfully).
However, it's almost unusable. The display is cluttered, in the case of
DHS, and DevilStudio seems pretty unstable for some reason. Neither demo
has adequate instructions, so I don't know if I'm doing anything wrong.

Of course, on that basis, why on /earth/ would I send them money for the
software? Because I saw it load on my Falcon, but didn't even get it to
recognise that I was pressing keys on my synth?

The answer is probably Cubase (or Steinberg, I should have Pro 24 but it
never turned up).

sighs

Richard

Hello All

New stuff on TAMW.

Been working on my pages today. Finally fixed my Atari Midi Review page. When I first did it way back when..I used MS word and saved as HTML. bad mistake. So I reformated it with a TXT editor, added more screen shots and have the new version of Pulsar as well as describing my experiences with Neil as beta tester of the new version.

Also Finally added ESQ-APADE caged artist editor to the caged artist page and download page. So...it is available now ..thanks to JOsTosBond (member of the Atari-Midi Egrp), who sent me a downloadable version.Read the freeware.txt.

Anyway...Enjoy!

1155. Papyrus Office/Base

Newsgroup: comp.sys.atari.st
Date: 2001-01-22 03:59:40 UTC
From: fried@dragon.achilles.net
Message-ID: <94gb7cnne1@localhost.localdomain>
Source record: 51389

Hi there, I've been trying out the demo of Papyrus Base. I already have Papyrus Word 8.23, and I want to see if I should upgrade to the full version. I can see that this is a really great program, especially that you can put pictures in your database.
I have had one problem though, after I have made a database I seem to be unable to add a new field. I go to the field properties dialogue, add a couple of fields, update the table. All seems fine, the table has the new fields, but when I go to "edit form" the new fields are not there.
Has anyone else had this problem?
Any info is appreciated, Mark

-Wopping big snip-

Try a boot manager like xboot, I dont recomend booting of the SCSI for a
couple of reason's, 1: It takes too bloody long, and 2: the OS files are
best held there for cosistancy. Most audio software I use, is Prog's on (IDE
1.4gig), data and scrap on SCSI. You get better performance as most decent
stuff need's scsi to write audio data, so if you have the prog on IDE it
mean's the program will NEVER interfere with a write to the drive when you
need all of that SCSI bandwidth.

I would recomend

215IDE CDE 45/80/80
540SCSI FGH
44Syquest I
Zip J
CDrom P

In the printer.cpx, Ports, Foreground printing. Printmon is used when you pick Background printing, so that will stop it from running. However, you should be able to use Background for nearly everything assuming MagiC is running (can't comment on MiNT).

>I guess the Epson640 driver is bad?

Those are the driver and inf files for an ESCP2 printer, ie your Epson.

>DJ_500C.sys, 68 761, 14/4/94

This seems to be a hangover from an earlier installation of GDOS on your system. The deskjet driver should be PCL.SYS and PCL.INF AIUI.

>right the first time around!) You may like to ask Derryck Croker as
>he wrote the review so I suppose he has it.

I did and I do, I also have the English docs and driver software for
download from my web site.

It was an awful long time ago when I installed this hardware, so I can't
give any advice. I do remember that I couldn't find the spot on the
motherboard to solder a wire to, but providentially the developer was at an
Atari show and was able to offer an alternative location.

As it happens, the STFM that hosts this memory board is for sale - it's in a
Tower case and also includes a 540MB SCSI drive, Link II, two DD floppies
and TOS2.06 - the Aixit board has 8MB on board. It can be expanded to more
by plugging in a bigger SIMM.

If you move the mouse, the screen don't go to black? It's happened only
when you stop to do something?
If your screen is ok during mouse action, it's not a feature in your
monitor but a bug in Centscreen or a configuration problem.
Give me the version number for the next info.

> Also how do I know what the screen refresh rates are? I don't want
>to hurt my eyes, does the accelerator help?
It's easy, use CENTvidel.

Hi Derryck

As my follow up makes clear, no problem, simple example of self help with the URL, did the trick. Interface is one of those programs that is SO good that without the manual you are scratching the surface. Looking at its RSC there are many many screens that never appear with simple viewing and translation of RSC files. But I'm not a programmer and am just very grateful for what you and the other members of DDP have done. I'm assuming that the RSC file with Papyrus Home as supplied with my Milan has protection, since it throws up an error 'incorrect version' with simple translation.

Bob.

Hi,

I don't know if this works on any machine other than Falcon but if you hold control from boot then this boots the computer allowing the hard disc to be used but it doesn't read the Auto folder, the newdesk/desktop.inf or ACC's.

Tim

I gave up trying to make a dual-system Falcon, and have made the internal disk my system drive. I can't be bothered partitioning it, so it's a whole 215Mb! Wow!

Now, I'm going to improve the system. First thing - no more error messages that I don't understand - is there an 'English' version of Kobold 3? Are there other places where non-english errors could be hiding in MagiC 5, NVDI or Thing 1.27E (assuming the E means English ;)).

Next, where can I find the various boot managers I've seen mentioned? BootManager, and XBoot? Don't care which, as long as I can boot a TOS/Customised TOS/MagiC/TOS With Backwards III or similar/ system which is clean in each version, with different ACCs and such loaded and all drives showing.

Finally, has anyone had experience of the Soundpool MO4 expander? Will this solve my MIDI problems (I can't use MIDI properly because I have a 16-part Multitimbral synth that steals all the channels, but can't really be removed by my system because I use it for strings etc.). What software do I need to use this? I've seen Cubase mentioned, as the MO4 gives /64/ channels (does that mean I'd have 80 Channels for MIDI, then?), and I guess I could use a MIDI-merge, or even a switch box, for handling the fun stuff like patch editing and stuff.

Richard, slightly calmer. But I still want a TT.

Source record: 51291

>>LFNs are stored in a different area of the disk from the 8+3 filenames.
>>Programs which don't understand LFNs are kept happy that way.
>
>Yes I knew that, but that doesn't answer the question I asked. How do
>*LFN partitions differ physically* - do they have a different directory

They have a seperate directory, which is accessed by programs which understand LFNs. All others use the usual TOS directory. There's no difference to the structure of the disk/partition, only the two methods of listing the files.

>structure for these long names or what? And how does the 'Temporary' bit
>of VFATCONF work? If you switch it on temporarily to save files and then
>switch it off again, are the LFNs still there when you switch it on
>again temporarily with VFATCONF? If so, presumably only if you haven't
>edited and resaved them in the meantime - or...?

The LFNs get written to the disk (if you save any) with the "Temporary" button set - they will reappear when you switch that flag back on. Beware of changing removable media with the temp. flag only set, you'll revert to the usual 8+3 until you switch it back on.

It's quite transparent.

>It looks like all the higher end characters(accents, etc) are printing
>instead of regular text. NVDI 5.03 works fine printing to the HP500

Sounds like it's a problem connected with the printer driver. It's sending
incorrect codes which the printer is interpreting as characters instead of
graphics control codes.

>results. I have the printer port on my CT2Falcon going to a switch box,
>from where I can choose the HP500 or the Epson640.

You've tried connecting the Epson directly? Although it's hard to see that
that would make any difference though.

1174. CAB.OVL 1.4200 released

Newsgroup: comp.sys.atari.st
Date: 2001-01-22 16:17:15 UTC
From: baldrick@dilbert.netset.com
Message-ID: <3a6c5d0b$1_2@athena.netset.com>
Source record: 51254

Version 1.4200 of my CAB.OVl is available for download now at my
website.

http://www.netset.com/~baldrick/ovl.html

Some low level changes to the OVl to handle dynamically updating
forms were made, hence the version number jump. This enables my OVL to
operate some sites that did not work previously.

There are still problems that people were experiencing in the
1.410x versions that are still being worked on. However this problem was
brought to my attention and was at such a lowlevel in the OVL, I decided
that patching it first was more of a priority. It's been in beta use for
a few weeks, with no new problems occuring from it, so I believe I can
recommend it's use if version 1.4102 was working well for you.

It's the best expander for Cubase.
Plugs in the parallel port.

> this solve my MIDI problems (I can't use MIDI properly because I have a

It comes with a MROS driver. Pop
it in your Cubase MROS folder and
hey presto.

> I've seen Cubase mentioned, as the MO4

Yes, and they're rock-solid, unlike
the cheap ones which go in the
serial port.

Umm, you may not want to have your boot sector your only one. It gets
a bit hard to keep track of changes if you do.

> Next, where can I find the various boot managers I've seen mentioned?
> BootManager, and XBoot?
XBoot is commerical. See http://www4.pair.com/gribnif/ for details.
It's not cheap. Other, less expensive boot managers work just as well,
but generally without the bells and whistles.

Version 3 of the screen saver Bubbles has been released
by Run! software:

http://www.run-software.de

Once again this can be downloaded for from their site
and includes an English rsc file but sadly no english
documentation.

I have started a rough translation of the BubbleGEM
help file (not to be confused with Bubbles the screen
saver) but I think it need better attention than my
amateur efforts.

I have an STe and I have never had any problem reading or writing to floppy disk and
transferring between the two. okay that's not completely true, I find that PC floppy drives
are basically crap, if you format the disk on your Atari ST (720k) then your PC will be able to read and write to the disk with out problems and vie versa :O)
the only time I have had problems is when I formatted the disk to 720k using my PC

Whoa, you are changing things at a pretty amazing clip. Lets back off
a bit.

> *sighs* All I want it a simple MIDI sequencer that works like TigerCub
> but better, and editor/librarians for my synths that work, and the
> whole lot being usable.

OK, let's start by ignoring Magic for a bit. It's flaky with certain
Falcons anyway. Partition your IDE as CD and get your sequencer
running with all the operating system stuff on C (32 Mb should be
enough) and all the programs on D. Make some music.

Once it is running, add your Zip, CD, Syquest and Seagate one at a
time, giving your system several hours (if not days) of use between
modifications. The order is up to you, but since the Seagate is the
largest drive, it might make sense to run it first. Add Magic only
once the hardware is stable. Magic may not ever be stable on your
machine, though generally it works.

For all I (or you) know, you've got a bad terminator or a damaged
cable, or perhaps a blown circuit on the Falcon. Or possibly you just
have a scrambled .INF file. I do know that you can do everything you
want with HD-Driver, so clearly you've got at least one setting wrong.
Unfortunately, there is no simple way to make complex modifications at
once. Start by doing what's important to you -- making music.

Once upon a time <94i38p$4if$1@nnrp1.deja.com>, atarigalen@my-deja.com
grabbed chalk and scrawled:

>Umm, you may not want to have your boot sector your only one. It gets
>a bit hard to keep track of changes if you do.

Oh, I've got my external drive partitioned, and I have a backup of the
system as is on Syquest - which may or may not boot, depending on when I
need to try recovering it, but it seems to work now.

I've also moved some essential utilities like Kobold to the same drive
as the system, just to keep it all together.

>XBoot is commerical. See http://www4.pair.com/gribnif/ for details.

Got the demo :)

>It's not cheap. Other, less expensive boot managers work just as well,
>but generally without the bells and whistles.

Stoop would appear to have not been updated. There's no price mentioned
for XBoot on the website, I guess it's a case of 'if it's /expensive/, I
do without'. *shrugs* I don't begrudge paying for software that works if
it's fairly priced. It's only lame demos like the thing SoftJee hope
will persaude people to part with serious money for Digital Home Studio
that make me wonder why they try charging for software.

Tim's Midi World has been invaluable for programs, but of course, the
/good/ programmers like the author of Explorer 32, which sounds like the
perfect app, have moved on and won't update them. I wish I knew how to
program, because I would happily modify something like that (with
permission) to be Falcon-friendly, with proper screen modes and such.

If the writers of demos like X-Mix III etc can successfully write
something that runs under MagiC, changes screen modes and doesn't trash
the computer, then I'm sure it's possible to write Falcon software that
is equally stable. In fact, Electronic Cow have done so, their programs
all work (even if one Atari retailer still has the freeware programs on
their site for $119!)

I'd love an Electronic Cow librarian/patch editor. I'm sure they would
have written something rock solid, nice looking and suitable for all
ST/TT/Falcon models.

> *LFN partitions differ physically*

There is an invisible file with the extended filenames within lfn
partitions. Whenever a filename is requested, the driver checks
whether there is a extended name to use instead of the 8+3. Regular
TOS/DOS ignore the file. Rather simple, really.

Actually, let me add: I think all programmers are good, just that there
are some programs which sound ideal, yet simply don't work. The Caged
Artist editors all seem to work with little trouble (except they don't
quit reliably, probably an MPE thing anyway), but there isn't a D50
editor for that series, only D110 (which works on by beat-up D110, not
listed below because I can't use it for music; the output stage is
damaged). DX Heaven is reliable, if picky about the sound banks.

grabbed chalk and scrawled:

>Once it is running, add your Zip, CD, Syquest and Seagate one at a
>time, giving your system several hours (if not days) of use between
>modifications.

It's all working - I think I posted later that I'd sussed out the issue
with two boot sectors on drives both configured as C:

FWIW, the drives are in a PC tower, so adding one at a time is slightly
awkward ;)

>The order is up to you, but since the Seagate is the
>largest drive, it might make sense to run it first. Add Magic only
>once the hardware is stable. Magic may not ever be stable on your
>machine, though generally it works.

Generally, MagiC was stable from the point of view that it started, and
stuff like Papyrus works. It's stable now, in fact, as re-install over
the old one, but with the old .INF file. I'm reconsidering an upgrade,
but I still think there are better ways of spending $100, or whatever it
costs. My Falcon is pretty basic, after all, the only thing not right on
it is the missing speaker (which I must find a replacement for - if
anyone is recasing a Falcon, I'd like that metal panel and some spare
screws!).

>For all I (or you) know, you've got a bad terminator or a damaged
>cable, or perhaps a blown circuit on the Falcon.

Thankfully not!

I'm quite pleased that now, although the problems with ACC/CPX still
remains, I can boot clean-ish TOS and run most of the older programs.
It's still not perfect; I still don't want to try using Backward on it
yet to see if I can get Explorer32 to work, for example, I'm basically
back to a reliable version of what I had, but with an internal drive
added. Generally, the MIDI stuff is behaving better, but that's probably
down to more cables being added and the realisation that one synth is
happily stealing all the channels.

shrugs
I still think it would be easier with a PC ;) But I'm sticking with the
Falcon until I've tried everything. Now I need one of those SoundPool
interfaces, which is annoying since I could get another instrument for
the cost of one :/

I would rather own an Atari computer/clone and then have an emulator to run any PC programs I see fit. SoftPC does that to a certain extent, but I would love an emulator that would bring up Windows. I know that sounds stupid, but I there are programs for the PC that I would not running. (ie JUGS).

OOPS! Nevermind, I figured it out myself. It seems you have to go into
Edit Form and copy one of the datafields (after setting up a new data-field
in Field Properties) then change the new field name using the data field
pop-up in Edit Form.
The thing I can't figure out is how to get an External file to be launched
in the database form. When I click on the file I get File not executable.
But I have already set up the Viewer Application in the Options menu for
that file type.
Has anyone got this to work?

Mark Friedman (fried@dragon.achilles.net) wrote:

Hi Sean,
Live but not quite complete. Still... it's a start.

Tell me, does the animated GIF look ok on your setup? The images
around the outside of it don't match up here. i haven't looked at it
with IE yet though...

Hi Rob,

>Ok.. I have an idea.. but it needs work.
>here goes..
>
>Set up a list of European users willing to purchase software and ship
>it to fellow users around the world.
snipped the rest...

In principle the idea isn't bad, but in practice you're looking for people living in Britain and Germany, since these are the countries where the software originates from. Once again the payment will be proove to be the problem... in Britain credit cards are quite common, this is not so in Germany, hence the fact that most German dealers don't accept them. It's estimated that 3 out of 10 families use these...
Atari workshop (formerly System Solutions) is a British based

>Why Paypal.com? International system, also screens users (valid credit
>card required). Bad part.. requires SSL and maybe Java.. so Cab is out.
>Paypal charges a small fee for each transaction.
Paypal may call itself international, in reality it isn't. As long as they don't accept users with a Eurocard/Eurocheque they single out 75% of the European customers.

What are we talking about here? software these days costs in the region of maximum 70$, most cost less... is it really worth going through all that trouble? If someone would want to buy a computer or other expensive item, then it's reasonable to take some safety measures...

>> Yes I knew that, but that doesn't answer the question I asked. How do
>> *LFN partitions differ physically*

There is no physical difference between a normal TOS partition and one with
LFNs. The only difference is will be within the directory when a LFN entry
is made.

>There is an invisible file with the extended filenames within lfn
>partitions. Whenever a filename is requested, the driver checks
>whether there is a extended name to use instead of the 8+3. Regular
>TOS/DOS ignore the file. Rather simple, really.

And also wrong. Here's a couple of hex-dumps from a couple of discs that use
LFNs. Neither are from Magic or Mint, but as both use the same format as
Windows, it doesn't matter.

The following hex-dump is taken from the directory sectors of a VFAT floppy
disc written to using Win98. As can be seen, the LFN is stored _BEFORE_ the
8+3 filename, rather than in an "invisible file"

Hello all!

A few days ago i found between my old stuff an old atari 520ST. It has 4 MB of RAM and a switch betveen original TOS and newer.(I think it's 2.x). I also found power supply unit and a diskete unit. The quaestion i have is : Could i use a PC serial mouse on atari or must be original one - i think i lost it, and the second question - How do i use this old Atari? I also have PC so what should i do to or need to connect this two machines?

Thanks for any help...

Source record: 51295

ATTENTION !

We have the possibility to furnish the MC68EC060RC50 and RC60 for the CT60 !
The EC is without FPU and PMMU ! See the web site for explanations.

No FPU (copro) means that the software that needs the FPU will not work (see
the list on the web site)

No PMMU means that the following functions are not possible :
- Virtual memory.
- Protected mode of MinT.
- Linux can't run ! We need an adaptation of uClinux !

A bit slower access to ST-Ram is possible too...

But the price is great !

The MC68EC060 costs only 40 U$D / 43 EUR

If you don't use Linux, Copro software (see the list on web site !!),
virtual memory and the protected mode of MinT, you may buy a such 060
and offer you a complete CT60 for only 200 U$D / 210 EUR !!

Sure, you can change the (socketed) 060 latter on the CT60 ...
NB : Cubase will run on a EC !

Let me now if you are ready to buy this configuration ....
Thanks

Date: 20 Jan 2001 11:33:06 GMT

Hi JI,

>I was interested to read in a previous contribution that ASH had
>sorted out various .OVL problems "years ago." I bought CAB v2.7 not
>that long ago and was advised that I had to get CAB.OVL from third
>parties.
AFAIK CAB 2.7 (German and English versions) comes complete with PPP and
the CAB.OVL, so either the package you bought is a "weird" one, or you
simply choose not to install PPP (also known as IConnect). Since the OVL
needs the IConnect stack, it's only installed when IConnect is installed.

>If ASH now have a working .OVL (something that should have been
>included in CAB from the very beginning) the least they could do is
>advertise the fact to their customers and allow them to download it
>for free.
Ever since CAB 2.3, IConnect was part of the package, the first versions
of the CAB.OVL worked quite well but contained some annoying bugs, these
were corrected in later versions. With every new version of CAB, the OVL
got better. The last update of the OVL was released together with IConnect
1.8, CAB 2.8 comes with IConnect 1.7 so ASH made the files public on the
download section of their website...
The English RSC for PPP 1.8 can be downloaded from Derrycks website, see
signature....

Remember that ASH is a German based company, they have excellent customer
support by means of the ASH Maus BBS, sadly this is of no much use to us
because of the expensive international phone rates.
In Germany a registered CAB user can download the latest updates/bugfixes
from the BBS. One could argue that ASH should put all this stuff on the
internet, and let people access the archives by means of a password/serial
number, but then what's the role of the distributor? It seems to me that
if you bought CAB from System Solutions, they are the obvious people to
demand updates/information from...

In general when you've bought software straight from ASH, they will sent you
the latest updates/bugfixes by email, drop them a mail stating the name of
the application, registration number and your customer code....

Cheers from Belgium
Dennis

From: Richard Kilpatrick <richard@lovecraft.demon.co.uk>
Date: Sun, 21 Jan 2001 14:00:15 +0000

Hi Richard,

>as far as I can tell, even if I
>boot from a Syquest, it's really reading a boot sector from the SCSI
>drive and HD-Driver is merely reading auto and inf files from the other
>drive - especially since the accessories and other stuff are still
>loaded from C. In that respect, the internal drive does nothing to help
>me other than add space. I like the way the system works under MagiC and
>Thing, when it works, it's good for file management and it looks nice.
The most simple way to get it right is:
Install MagiC from scratch on bootpartition C, the installation program
wil put the booter program in the AUTO folder and both the MAGIC.RAM file
and MAGX.INF in the root of partition C. All other stuff is written into
the GEMSYS folder.
Once it's installed you have to but a bootselector like XBoot, Superboot,
Stoop... etc in the Auto folder. This program should be the first one in
the folder, so that whenever you boot you can select if you want to run
under plain TOS or MagiC.
Although MagiC will boot from partition C there's no reason why you can't
put all MagiC related files on the additional SCSI drive, you can i.e copy
the complete GEMSYS and THING folder to that drive, all you need to do is
to set the path of the folders in MAGX.INF.
For compatibility reasons with TOS, it's better to leave the CPX and ACC's
on partition C.

>I'll swap my system for a TT system of similar spec (700Mb (215int, 500
>ext) of storage, CD drive and Syquest, VGA monitor (a monitor capable of
>displaying a high resolution with lots of colours, or Mono), 14Mb RAM,
>FPU.
>
>Or a MegaSTE plus cash.
Whatever you get.. the problem will remain, there's no way you can start
an OS after bootup, it's not MagiC related, MiNT and Geneva need to be
started from the Auto folder also.

>The final option is becoming more attractive - a PC, with a couple of
>MIDI interfaces and nothing else.
This may sound a bit harch.... considering you can't handle a very simple
OS like MagiC yet, I would really love to see you fight with a non-logical
monster like Windows :-)

>Any ideas for fixing this lame MagiC OS would be welcome. Upgrading to
>6, no matter how much better it is, will /never/ happen as long as I'm

>convinced that whoever wrote it should have perhaps actually used it for
>what Ataris have always been used for before releasing it.
It's not MagiC related... it's the way Atari's are designed, since they all come with TOS in ROM, running a different OS means that one has to disable TOS first or overwrite it in memory, this can only be done during bootup... updating to MagiC 6.10 will change this.

>Why is this machine so utterly unreliable, even though I finally got DX7
>software that works, running KCS Omega and the/supposedly/ matched Caged
>Artist editor DX Heaven under MPE causes corrupted screen displays, and
>don't even touch the stuff that allegedly works with Roland kit.
The Falcon has many virtues but when it comes down to compatibility with the ST.... most of the midi applications were written years before the Falcon was lounched, it's not really fair to blame it all on the Falcon, the TT has similar problems, the programmers are the ones to blame... but since they left us years ago..
I`m not an expert concerning music/midi applications but surely there must be some specific written stuff for it? after all, they always told me that the Falcon is *the* machine when it concerns music...

I've dropped a bootselector program in your mailbox, just in case you haven't got one or haven't a clue what I'm talking about, if you encounter any more problems setting up MagiC just drop me a PM, and we'll sort this out in no time ;-)

Cheers from Belgium

Hi Edward,

>That may be true for you, not for me. Photoline does not run under
>Mint/N.AES for me, but I would imaging that I do not have things setup
>correctly. I can say that about 99% of the programs I have tried run under
>Geneva.
Photoline runs perfect under Magic as well, so either you haven't set it up
correctly or are using the wrong version.
In general it's safe to say that commercial software developed since 1995
will run just fine and like intended under MagiC. While Geneva may be the
most compatible of the three multitask capable OS. it's also the most limited
as far as features go.

Cheers from Belgium
Dennis

Hi Steve,

>I would like the widow update function to speed up a /lot/, and would
>like to be able to use MGCOPY in favour of Kobold or JinCopy as file
>copying is dog slow..
So would I... Jinnee is developed on a Mac running MagicMac, the author has no idea about some features being rather slow on a normal Atari. The only way to get this and some other goodies implemented in the next version of Jinnee is to flood him with mails. If there's one thing that programmers love... it's constructive criticism.

Cheers from Belgium

> extension?

Only if you have the ET4000 version of NVDI. You should be able to use NVDI 4 together with the original Crazy Dots driver, but I have never used this (I installed NVDI5 directly) so I don't know any details about this. But the general rule is to start the original driver first, then NVDI. You must also disable NVDI's screen drivers, they're called NVDIDRV*.SYS and should be deleted or renamed.

> Does anyone know what the latest version of NVDI is?

5.03 AFAIK. From version 5.00 the ET4000 version is included in the normal distribution. I'm using NVDI 5 on my Crazy Dots and it works great, even though it's quite slow.

The last bit there is a problem with STiNG and it's hard to work
around in any sane way. Peter felt very firmly that it was impossible and
not really pratical to define a sense where the TCP/IP stack was offline.
There is a corresponding failure to report when there is no route to the
host via the resolve() call. For me on my setup going from online/offline
browsing is painless effortless and require no user intervention.

My OVL first checks the online state via a call that only STiK(2)
fully supports. Even if this routine were not working it should be caught
in the resolve() call. STiK2 does this now, STiK1 did not do this.
Basically if it can't resolve an address since it can't reach the DNS it
is nice enough to inform the calling client of this fact. I've verified
that this works with my setup. But when the stack insists that it is
online all the time and refuses to return back on a call that it cant
reach a host, there is not much sensible that can be done.

As to the lags I can not say they happen for me or most of my beta
testers anymore. I do get reports of them happening but it is almost
always related to someone using STiNG. I'm not certain why they are
happening. Having never set it up on my system, I can't really test it.
Nor am I really inclined to install it. The routines are fairly straight
forward. If there is data for the client to retrieve it retrieves it,
when there is no more data to retrieve it goes into a cooperative mode
with CAB waiting for data. My guess would be that if this doesn't happen
for you on other stacks, then STiNG is having a temporary block on
reserving the memory and this is causing a packet to be missed and a
stepdown is occuring on the connection while it negotiates out what data
is missing and when to resume full speed transmission.

As to your question on a site that works or don't work. Here are a couple for you to try with the Iconnect OVL.

http://www.forbes.com/

http://www.planetarion.com/

Planetarion is an online game so you need to join to really hit sections where the dynamic forms are located. I am curious as to whether planetarion works, as while CAB does not behave in a manner that is what you would expect, it does handle all such forms in a standard method. So standard in fact that it is curious that this information was not passed on to outside developers.

The client only downloads, it's up you to to figure out how to
play them, but you probably knew that. The legal mess is why
there is a unix port, not much time was spent, except re-compiling
the sources, and that probably didn't take long if it was Franks
Milan060. I don't think anyone wants to wast time on a GEM napster
client either, indeed it seems like it would be a waste of time
in the long run. The unix port works though, I tried it. ;-)

CD = CrazyDots

I have a CD card on my TT so I have to disagree, the *.sys files don't
need to be removed. I think you might be confusing the Nova with the CD
card. Also do not install the original CD card drivers at all, nvdi
4(et4k version) or nvdi 5 will drive the card all on it's own.

I had both a Nova and a CD card and specifically sold the Nova
because I had to disable part of NVDI.

Once upon a time <980272750-52324AEicMi@gmx.net>, Dennis Vermeire
<dennis.vermeire@gmx.net> grabbed chalk and scrawled:

>Whatever you get.. the problem will remain, there's no way you can start
>an OS after bootup, it's not MagiC related, MiNT and Geneva need to be
>started from the Auto folder also.

nods That's not really the issue, I was thinking more in terms of the
unstable nature of the MIDI software when confronted with a Falcon.

>This may sound a bit harch.... considering you can't handle a very simple
>OS like MagiC yet, I would really love to see you fight with a non-logical
>monster like Windows :-)

laughs I've been using Windows since 1985. I'm running Windows 2000
right now (I started with Lisa Office, so I've been using GUIs for a
long time). MagiC isn't a problem in itself, it's simply highly
unpredictable.

For example, my machine is doing the same thing again - booting up,
reaching MagXBoot, and either locking up or displaying garbage (but
continuing to boot). Why? It's even doing it when I start the Falcon
with no SCSI devices.

I can probably fix it by re-installing MagiC, but the only thing I can
think that I did wrong was forgetting to skip the memory test. Whilst I
/know/ MagiC doesn't like the memory test, why on earth should it trash
it so I have to re-install it?

>It's not MagiC related... it's the way Atari's are designed, since they
>all come with TOS in ROM, running a different OS means that one has to
>disable TOS first or overwrite it in memory, this can only be done during
>bootup... updating to MagiC 6.10 will change this.

I'm not entirely convinced that I want to spend $99 on an OS that really
can't behave.

>I`m not an expert concerning music/midi applications but surely there must
>be some specific written stuff for it? after all, they always told me that
>the Falcon is *the* machine when it concerns music...

A small amount. It's not the main programs, which are okay, Cubase etc.
apparently work fine. It's those useful little utilities, patch editors,
librarians. I have the Electronic Cow software, and it's great.

>I've dropped a bootselector program in your mailbox, just in case you haven't
>got one or haven't a clue what I'm talking about, if you encounter any more
>problems setting up MagiC just drop me a PM, and we'll sort this out in no

>time ;-)

I'll see what happens with the bootselector - perhaps I can work out why
MagiC is being so unreliable at the moment, since I see no other cause
it must be the memory test. What does it corrupt? I've tried replacing
the .RAM file, the contents of the GEMSYS folder. It makes no sense.

1236. Cubase Studio/Cue Trax Modules Problem

Newsgroup: comp.sys.atari.st
Date: 2001-01-23 19:45:29 UTC
From: Dylan O'Brien <dsobrien@earthlink.net>
Message-ID: <X91tOplAZC7VaOAnkGMpGva8Hq=A@4ax.com>
Source record: 51317

I just bought The Studio and Cue Trax Modules and I am having problems installing them in Cubase Audio Falcon 2.06. All the programs are originals, not pirated. I followed the instructions exactly. Copied both modules to my hard drive and when I try to activate them, Cubase crashes on me. It doesn't ask for the original disk for copy protection, just crashes. The disks do not appear to be corrupt in any way. I'm not sure if there is something I am not doing, or something I have set up wrong, or some incompatability.

My system is a Nemesised Falcon, 14megs running NVDI 4, HDDriver 7, FDI interface, MO4 midi interface.

It took me almost a year to find these modules, so any help would be greatly welcomed.

thanks,

Dylan O'Brien

If you use NVDI 4 it has to be the specific version for Crazy Dots. The
version for regular Ataris won't work. Try get your hands on NVDI 5 since it
supports all gfx cards. Also visit
http://members.tripod.com/~TT030/CrazyDot/crazyd-e.htm lot's of useful info
there.

1238. Still Having problems with Crazy Dots

Newsgroup: comp.sys.atari.st
Date: 2001-01-23 20:18:07 UTC
From: Demon News <mark@recycledsteel.co.uk>
Message-ID: <980252378.23829.0.nnrp-08.9e98a620@news.demon.co.uk>
Source record: 51293

Some time ago a was trying to sort this problem out, I never managed an eventually gave up. I am now again after a solution.

I have Magic 6 on a TT and was told to use NVDI but unfortunately the version I have is 4 (I am sure there are newer ones about). It was nearly working, I got a number of test images working and made a 'file' of the resolutions I wanted to use. When I booted the machine I got a 'text' program up asking what resolution I wanted to use, only problem was that the resolution names were all messed up.

I did find I conversion program for the 'file' but this did not solve the problem, well I think that is what is did.

From the collection of software that I have acquired over the last few months from purchasing a number of Megas, Falcons, etc I believe the latest version I have of NVDI is 4 (with instructions, etc) but I also think I have a newer version too and may be getting the files, programs mixed up.

Should NVDI 4 work fine with Magic 6 and Crazy Dots card with 15 Bit extension?
Does anyone know what the latest version of NVDI is?
Were I can purchase it from if needed (UK but I don't mind shipping from abroad)?
Any other ideas about the Crazy Dots Card?

Mark

1239. Terminal Program and CDROM drivers

Newsgroup: comp.sys.atari.st
Date: 2001-01-23 20:29:24 UTC
From: Demon News <mark@recycledsteel.co.uk>
Message-ID: <980253056.24154.0.nnrp-08.9e98a620@news.demon.co.uk>
Source record: 51294

Anyone know were I can get a good terminal program to send files to my Falcon and TT, i.e. one that uses Z Modem, High Speed comm ports and supports multiple ports too and maybe Magic?

Before you mention ParCP or whatever it is called, I would love to use this as it would be faster but can't be bothered to make the cable, anyone sell them?

I Have been burning CDs which worked fine on the CDROM drive I use on my ST but the external on my TT only 'appears' to work, file names, sizes and copying all seem OK but files end up being corrupted, I may change the CD-ROM drives around as I know the CDROM did work but that was before it spend 2 months at sea.

I think I use Extern Gold on the TT but MetaDos on the ST, could the driver be the problem? which drivers are good?, could it be Termination or simply the fact that the External on the TT does not like CDRs (I think it is a Tech MultiSpin 6X or something).

Any help would be appreciated.

Mark

1240. Re: $^&*"$^%(*$" Falcon.

Kilpatrick <richard@lovecraft.demon.co.uk> grabbed chalk and scrawled:
>For example, my machine is doing the same thing again - booting up,
>reaching MagXBoot, and either locking up or displaying garbage (but
>continuing to boot). Why? It's even doing it when I start the Falcon
>with no SCSI devices.

I've got a sneaking suspicion that this is caused by spurious signals
from the MIDI-in.

Don't ask me why, I just disconnected the MIDI in jack-lead (I've got a
balanced patchbay with special MIDI leads) and it booted.

I still say MagiC 5 sucks, if only for being so daft as to cough on
spurious MIDI signals ;)

Just what did he say. I guess the best thing to do is to wait and see the
final product and what it can do. I am willing to go into this with an open
mind. If I like what I see, I just may get one and it will not be the first
time I did something people did not agree with. Afterall, I am an Atarian.

You can use a serial PC mouse on the ST. like I do, if you get Mario
Becroft's serial mouse adapter. http://gem.win.co.nz

How do you want to connect the two machines. There is a program called
PARCP that will connect the PC and the Atari through the printer ports and
allow you to move files between them. Try this site for that:

Hi Neil,

Zetnet was the first service I used but I switched to Freeola over a
year ago. IIRC the different services on offer just relate to how
much time you intend to spend online and how much you are willing to
pay. The service was first rate though, I never had any problems.
The option I went for was limited to so-many hours per month which
I think cost £50.

Since I don't spend much time online I decided to go for a free isp.
I tried Freeserve at first but couldn't get a connection. Next I
tried Freeola, subscribed online and with some help from this group
got connected. The service is good and fast but they have no non-PC
experience so you cannot rely on tech support who assume you are a
dumb PC user.

If you would like to give it a try then I have posted some
skeleton scripts for STiNG on my web page:

www.peterslegg.scubadivers.co.uk

I use Sting version 1.26 but it should be ok with 1.22, I would
recommend the upgrade but have heard of some people having problems.

Regards,

Peter

Hi Peter,
I'm desperately trying to remember which ICD had AHDI compatibility -
it was either 5.5.0 or 6.3.x, but I can't remember. What I do seem to
recall is that with this version the drive would have to be
re-partitioned to be AHDI-compatible. Just using the driver was not
sufficient IIRC.

Does that help?

Once upon a time <G8pb6.6178$eI2.100993@NewsReader>, Barrie at
Atarispares <barrie@keychange.co.uk> grabbed chalk and scrawled:

Hallo Barrie! Wondered where you were hiding in all this ;)

>Can someone confirm it will definately work with a Falcon, last time I
>tried, it didn't.

Hmmm. This is why I'm not throwing ï¿½149 at one ;)

It /says/ it works on the Falcon on System Solutions website. Since I
don't have Cubase, I don't suppose they'd let me blag one for
experimentation ;)

>On the ST and TT , along with the Unitor and Midex, (in stock), agree,
>Falcon, see above.

Well, the choices for the ST and TT are much wider (hence my original
"I'll swap the Falcon for the TT" - I don't need hard disk recording,
and if I did, I wouldn't be using the Falcon anyway - I have access to a
Roland VS880Ex.).

However, I just got /two/ instruments behaving, with all of them
switched on - Electronic Cow's Arp program, running under MagiC, and no
problems beyond some graphics corruption.

How?

>Have you tried a setup/sysex dump to defeat unwanted channel reception?

No, but I also had read the manual, which when it's Roland is always a
bad idea.

Press MIDI, go to the required part, select Rx Channel: OFF ;)

hand-forehead-staple

It also cured the communications problem with the DX7 when other
instruments are on, a note-off issue with the Kenton Pro/Solo, and
allowed me to do one SYSEX dump from the D-50 before it got upset (which
is fairly normal for the D-50, so I'm not worried about that).

I still don't trust it - yet - to upload some patches for the D-50, even
though D110edit has been reliable - but it's behaving better.

I doubt it's cured the weird MagiC/MIDI-In and instruments on booting
problem though.

Wonder how it will get on with my S-50 sampler ;)

They should ask for the master disk for the authorization.

Do you have the latest versions? The Studio Module was the only one
updated to I think 1.06 or 1.04. My Falcon is not nearby.

I have a AB040 & Nem inside but I use a patched version of Atari's AHDI.

Rich

Then you, Sven and Uwe and I have different opinions. I've been doing some (not very much, but some) reading about the ColdFire lately. And I've come to the conclusion that nearly ALL software that I use will run on a CF 4e base cpu in forseeable time. Now, this does apparently not apply to HDDRIVER, as Uwe thinks this is a crazy idea. Also, AES could be a problem, but I think XaAES will help me there. Now, the software I use is mostly supported, and the operating system I use I can recompile anyday. (except the AES .. . yet) Ok, I will definately get problems at first, but I think that within a year a CF 4e clone will run quite fine. Besides, I would not use this Hades programming it using exclusively ASM if I didn't like problems/lack of software :-)

If such a machine actually became available, do you think existing software authors would let it go without their software?

Anyway, if Pegasus with the 4e based CPU appears, count me in!

Regards from the only potential CF 4e (and Hades 060) owner in this group,

Odd Skancke - ozk@atari.org - http://assemsoft.atari.org

1259. Better than Ghostlink To network ST and PC?

Newsgroup: comp.sys.atari.st
Date: 2001-01-24 08:56:04 UTC

Source record: 51343

I tried Ghostlink to access the hard disk of my PC. The direct access
like any atari st drive is a good thing but It is too slow and often
crash. I tried also ParCP3 which is faster but It need running a program
and is only a transfert (need free space on local hard drive ...).

Is there a soft like ghostlink and as fast as ParCP ?

Thanks.

Guillaume.

I guess you mean in the UK?

If so, is there really any need or call for an Atari show?

By the very nature of the Atari scene in recent years, most people
using them don't live near to a decent central location such as
Stafford, and a long trip is not financially possible or even
worthwhile for them.

The November Stafford show only had about 5 stands of Atari relevance
despite the organisers' offer of free or reduced rate stands.

I think we all have to face the fact that the UK Atari scene can't
support a printed magazine, or shows, or even keep a few dealers in
business nowadays.

Sad, but true I think.

Or am I misreading the situation?

Best wishes
Mike Kerslake

Go into a computer shop and buy a ready-made cable - check that the plugs
aren't of the moulded type. Open one plug, unsolder and swap the position of
two wires, resolder, close plug, job done.

Can't help with your TT questions I'm afraid - Atari Workshop is the place to
update your NVDI from though.

As also here - but only if the STinG dialer had previously been loaded -
doesn't matter if it had subsequently been quit, or indeed even used to connect
to an ISP. Olivier made a move towards implementing a way round this problem,
but it's nowhere near perfect - hence my reference to dialog boxes.

I can also understand that you don't really want to support anything other than
STiK, but this stack won't be compatible with all ISPs. I'll cite Redhotant as
one such, neither STiK nor IConnect would touch it. I won't pretend to know
anything at all about this, but STinG's addition of a Hostname variable meant
that I could carry on using this freephone service. I've a feeling that the
popular UK Freeserve ISP is also a STinG-only candidate, from what I've been
aware of in other peoples' messages and experiences.

I think that the internet has killed the printed magazine side of
things; after all, it's a lot easier to find information and it's
cheaper. I don't think this reflects a drop in the numbers, merely a
change in the way the information is handled.

I can't go to shows in Stafford; it's not worth it. If there was an
Atari dealer I could walk into and buy programs off the shelf in
Edinburgh, I probably would do.

Interesting. So am I the only falcon owner where that version of
GTLOOK doesn't work ?
I got it from Dennis and from Bob King - thanks to both - but neither
program worked here. So I would like to find out what's the reason
that it works on other falcons but not on mine.
My old 2.0 version works okay which makes it even more strange.

BTW the system is TOS 4.04, HDDRIVER 7.81, NVDI 5.03 and CT2.

I think the problem may be that if you are not booting off C, you should
have no accessories on C. The manual says something like:

HDDRIVER can boot from any desired partition. You only have to press the
corresponding key when starting up the system. In 'Boot Drive' you can
set the default partition to be booted from if no key is pressed. When
booting from a partition other than C:, desk accessories will only be
loaded from the boot-partition if there are no accessories on C:. So if
you arrange for multiple boot-partitions, you should forego using C: as
a boot-partition and thus also not put any desk accesssories on it.

>Now, in the interests of trying to fix the damn thing, I installed

>
>Rebooting, it appeared to boot from Drive I, showed 4 drives, but only
>one appeared on the desktop. When I 'install devices', C drive becomes
>empty, i.e. the poor thing doesn't know if Partition C, SCSI ID0 is C,
>or I: is really C:.

Did you set I: as the boot drive with HDUTILS? or hold down the I key?

>Now, I think MagiC is expecting the IDE drive to be the boot disk, even
>though there is /nothing/ on there, and as such, gets upset. I've tried
>re-installing MagiC on C, with no change - garbage as soon as the
>MagXBoot program has run, either instantly or after it's locked up and
>I've reset.

The order that the devices are scanned can be altered in HDUTILS by dragging the IDs to the desired position. But why don't you want to boot from C? It's much easier, as you then don't *have* to connect tthe other drives - say if moving the machine temporarily elsewhere.

Can't help with your other queries, sorry.

Thanks Galen, Very clear. So I assume when you use the 'Temporary'
setting of VFATCONF this enables reading of this extra file on a
normally non-LFN partition? And I presume this file is re-writen each
time you add an LFN file?

No problems with the control panel here.

> I have tried re-installing NVDI 5.03 but it doesn't change things.

I too have a CT2 falcon so this shouldn't be the problem.

> can anyone offer any clues as to what could be the problem?

Only things different seem to be the switchbox and the application.

Have you tried to print from other applications ?
Have you tried deinstalling the HP and removing the switchbox ?

Gerhard

I'd figured out the scanning priority, so that did solve that problem -
I select(ed) boot by holding down keys.

I've got a boot manager now, so I don't need to boot from other drives,
I simply disable accs/MagiC as required :)

It seems that the GTLook archive requires a PAR file to work with some
types of Epson scanners.

I've updated the archive on my web site to include the necessary.

Yep, you read it right.

This STFM is housed in a Tower case and (along with the 8MB Magnum/Aixit
memory card) also houses:

Two HDD floppy drives
540MB SCSI drive (NO software!!!)
Link II host adaptor + socket for external devices
PC AT-KEY keyboard interface

Collection (from Watford, Herts) only.

Offers are invited.

>It is simple just rename yours virtuals hard drive 80meg with c notC.or D
etc...
Then you can directely use your window stuff.
I test direct download from internet, drag and drop from 2 windows, and
direct acces from zip and cd to the virtual.hard drive .You can redirect
archive file zip for example and do directely the d&#65533;compression in the
virtual disk.
I don't try to do the same directely with the &#65533;mulator.
The other possibility, it's image disk; "Gemulator explorer"
You can use another very simple installation prog emulation.
You can do the same with the last version of "STEEM ENGINE"
This is really good stuff with midi in&out support , compatibility with a
lot of midi prog.
http://steem.atari.org

You can count me in. Having hand assembled a Hades060, perhaps
the only one in the US to do so, I for one think the lastest
news release sounds positive at any rate. Just like you
I have a Falcon, TT030, and a Hades060 all in the same room.
If I had yet another even more powerful clone sitting next to
these, why not? I think some very interesting things coming
for MiNT would make such a machine quite very nice to have.

Oh ok, you are mixing the normal nvdi version with the original
CD drivers. The original drivers were horrible, that cannot
be very stable, but I guess it's an option if one is desperate
or does not have the et4k version. Sorry I missread.

My Nova was not a mach64, it was a cheaper et4k card as I got
one of the low-end ones. The CD was actually faster than my
Nova. At the time I could not afford the high end Nova model.

I have the Supra Drivers is you want them, not as god as HDDriver or ICD but they do work and you can simply select the model you have and it will sort it out.

> It has one cable about 2 feet long with a 19 pin connector. On the back

> printer port? Thanks a lot.

On the back of the drive units are 2 ports one is an ACSI port (the same as on the ST), yes this is for adding extra devices and the other is a standard SCSI and again it is for adding standard SCSI devices.

Opening the unit up you should find a regular SCSI 20Mb drive in it, I seriously recommend finding a newer unit to increase size and speed. With this controller I have seen a 400Mb drive, CD-ROM and DAT drive running with no problems, this is using the Supra drivers too.

So the AGP standard is based around PCI, but is not a variant ?

due to a lack of official blessing ?

There are a lot of PCI variants out there that where never officially
sanctioned by the PCI owners, like the property extended PCI cards
in some PPro servers that predate the newer PCI-X standard (or the now
dead PCI64 unofficial attempt), these are and will be considered PCI
variants, along with the AGP bus regardless of any homage (or silence)
by the PCI standards group, or attempts by script kiddies to stretch
the English language to new and wondrous meanings

No, you're the confused one here ;-) If you *don't* have the ET4000
version of NVDI (i.e. NVDI >= 5 or NVDI ET4000), you *must* run the
original drivers first, and then NVDI (if you want outlinefonts and
printer support). But NVDI doesn't know about graphics card, so it will
automatically try to install it's own drivers. These must be disabled,
otherwise the system will crash.

> card. Also do not install the original CD card drivers at all, nvdi
> 4(et4k version) or nvdi 5 will drive the card all on it's own.

Exactly. But the original poster didn't have a NVDI version that supports
his graphics card.

> I had both a Nova and a CD card and specifically sold the Nova
> because I had to disable part of NVDI.

Then you made a bad deal. The Nova card is a lot better than the CD, it's
way faster. ET4000 cards are very slow compared to the Mach64 (or 32) in
Nova cards.

NVDI 5 only supports ET4000 based graphics card the last time I checked.
This includes Crazy Dots (2), ET4000 based Novas, VoFa and Panther (II)
ISA adapters with ET4000 cards. It does not support cards like the various
Matrix cards, Mach based Novas, Eclipse or Cyrel cards. These needs
additional software.

Hi Jo,

JES>Only if you have the ET4000 version of NVDI.
yes, but from 5 onwards NVDI didn't make any difference between
graphics.

JES>But the general rule is to start the original driver first, then NVDI.
But NVDI is able to replace the original drivers.

JES>You must also disable NVDI's screen drivers, they're called
JES>NVDIDRV*.SYS and should be deleted or renamed.
You can do so, but you needn't.

1290. [WEB] Aniplayer 2001 v2.14

Newsgroup: comp.sys.atari.st
Date: 2001-01-24 19:46:49 UTC
From: didier.mequignon@REMOVE.wanadoo.fr
Message-ID: <94nbf9$k1m$1@wanadoo.fr>
Source record: 51222

Hi,

The latest version of Aniplayer is on my site.

News on this version 2001 (2.14):

- Format audio DVSM (Falcon Winrec).
- New scripts with GEMScript for convert a file MPEG or a directory.
- Virtual screen in True Color under FALCON (without GEM mode).
- MP3 DSP part more fast.
- Statistics DSP for MPEG Audio.
- Possibility to choice the sound track with some QuickTime files.
- New box for edit the Playlist when alignment is checked (entries for
title, author, album...).
- The playlist now works with 3 digits and 256 entries.
- New look for the Playlist.
- Xgem protocol used for display icon in the window's title under
MagiC (.SLB from Eric Reboux Software: http://ers.free.fr).
- The font selector replaces the little font option for the Playlist
(MagiC or Wdialog compatible).
- Bugs with MP2 32000 Hz, MPEG Audio tag ID3 fixed, video MPEG, etc...
- And more...

Regards,

Didier.

1297. TT vs. Falcon?

Newsgroup: comp.sys.atari.st
Date: 2001-01-24 21:58:28 UTC
From: Richard Kilpatrick <richard@lovecraft.demon.co.uk>
Message-ID: <3JXbEaGEA1b6Ewed@lovecraft.demon.co.uk>
Source record: 51226

I can't find anything which really compares the two machines - I know they are similar values, so which one is better (I'm using my Atari for music, but I haven't made use of the Falcon's DSP especially - apart from as a voice changer ;)).

What are the fundamental differences in operation between them, and is the TT any more reliable with software written for the ST such as Explorer32?

Richard

>HDDRIVER, as Uwe thinks this is a crazy idea

I was thinking the same thing about HDDriver. I would think it would still work if the compatibility thing is as high as what has been claimed. Still, I would hope after the computer is built we will get info on what programs will run and what will not...

> If such a machine actually became available, do you think existing
>software authors would let it go without their software?

I do not think so really. I would hope that more authors will come on board. I would assume also that your driver for the SB cards will work just fine..

> Anyway, if Pegasus with the 4e based CPU appears, count me in!

Basically me also. I received an email about the Pegasus. I asked them about the price and included softare/hardware. I was the price would be about the same as a PC and that they could not comment on the included software/hardware...

I'd think so, but the previous reply to my post infers that the LFNs
are actually in the directory somehow (perhaps in addition?) I do know
that when I transfer LFN files from Windows 98 to my Atari there is a
little invisible file on the diskette that goes with each LFN file that
I can see on the Atari, but not Windows.

Regardless, I'd think it safe to assume that the LFN data is updated
with each LFN file.

from my understanding, the TT has a faster CPU than the falcon, in stock standard terms im talking, as for reliability, I think it would be just the same.

but the falcon is used predominantly for music and graphics where as the TT for business applications.

Their website is now selling Domains/Webspace, which is a bit
disappointing - but typical of Atari website links *grins*

Was there ever a board which allowed the Falcon to use more than 14Mb?
Other than using expansion cards of course.

(Having read a report on the CT2 and seen a picture of Shiuming's Mk. X
cased Falcon, I think I know what I have to do ;).

Where do you find information on the hardware patches?

If it was an ET4000 card you could use NVDI ET4000 on it. It should be
just as fast as the Crazy Dot, unless it has less RAM. I don't know much
RAM these cards had, but it should be 1Mb or more.

> same.

Not only does the TT have a 32MHz CPU, but it's a true 32 bit 68030 and
not a crippled 16/24 bit 030 like the Falcon has. The TT has a 16 MHz bus
like the Falcon, but it's full 32 bit and not 16 bit.

A TT is atleast twice as fast as a stock Falcon in every way, unless you
use the DSP on the Falcon. But the DSP is of very limited use, in real
life only sound applications benefit from it.

The TT also has lot more stable hardware than the Falcon, and the SCSI
controller is very reliable. In general I'd say that a TT is more stable
than a Falcon, although this depends on what software you use.

> but the falcon is used predominantly for music and graphics where as the TT
> for business applications.

Define "business" ;-) The Falcon is much better suited for games, demos,
graphics and sound in general. But the TT can have upto 256Mb RAM, and
with a graphics card (Mario Becroft is selling his Galaxy card now I
believe) it beats the Falcon easily when it comes to "serious" graphics.

The Falcon is more fun though :-)

>> they are similar values, so which one is better (I'm using my Atari for

The Falcon is probably better suited for your needs.

>> What are the fundamental differences in operation between them, and is
>> the TT any more reliable with software written for the ST such as
>> Explorer32?

I don't know Explorer32, but the Falcon is generally more compatible with
older ST software.

>As far as I can tell the options are PPC, Coldfire or Intel (8086 type
>stuff), there are others (RISC stuff, etc) but I think these are the ones in
>the general market and with a price tag the majority of us can afford.
>
>What do people think the future is?

Future?

points at BeBox, Acorn, Milan II

I still maintain that the answer is to produce a rackmounted, dead
straightforward TOS machine that will reliably run all the old music
software, but with a better file manager (Long File names). Something
can can smart-sort resources so even if you're running 24-bit colour, it
can get a mono resource item and display it correctly. A Falcon with
real addressing, so newer software could be written to use it. Then the
studios would buy it to replace dead or dying STs ;)

The BeBox was great. It offered something unique, and was beautifully
made. It was still a commercial failure.
(I owned one. Seriously. They were good machines).

I'd rather pay programmers for new/updated software that works, than try
and spend a stupid amount on a 'new' computer system that is
uncompetitive performance/price wise - the Wintel legacy can easily be
broken with different OS, and there's no escaping the fact that for
ï¿½1,500, you could either have a complete 1Gz system, or an 80 or so MHz
clone.

I hate being the one who always says this, but it's true. No matter how
much you love STs, the fundamental platform is inferior to many others
which have failed. The RiscOS market is barely limping along, and they
have embedded applications to keep them going (Bush Internet TV, for
one).

What do you think the worldwide market for such a clone is?
They sold 1,800 BeBoxes. 400 were developer systems when a new OS was
being created. Have you looked at the number of people online with
Clones?

I took your suggestion and e-mailed support. I got a reply within a few hours, but basically it just confirmed what I had run into and that there was no way to have both an Atari virtual HD and a real Windows HD available at the same time. He recommends going through the floppy to transfer files.

He did say I could install Atari software to read the CD, though.

Still, it seems to me that someone should be able to whip up a utility to copy files into a virtual hard drive file (or even a virtual floppy file).

I'm using a Stylus 860 with NVDI 5.03
on my CT2 Falcon.

Hi,

I am using a program to increase the resolution of my falcon but I can only get the higher resolutions in 16 colours.

I was wondering if there was one that may be able to do it in 256

Tim

Hello Tim,

i have fooled around with Videl Inside, which can get 800X600 in 256
colours. The stability of the video depends on the Falcon used.

Maybe it's under construction. I'll check later, it isn't hosted by
the atari-computer.de is it? Maybe someone else knows a URL as I got
it from a magazine about 3 years ago.

>Btw. Lyndon, did you make any progress with that RAM expansion you were
>contemplating (or has the project been put on ice)?

No I gave up, bought a Falcon. Besides memory there were too many
problems, especially the audio side of things. I also bot board of
B&W screen. Chickens way out, maybe, but once I've paid for all the
stuff to make the card, I would have paid for half a Falcon.

Claes Holmerup (I'm really sorry if I spelt that wrong) and Jo Even
Skarstein's site. Don't know the URL off by heart, but a search will
pick them up. You'll need knowledge of SMD to touch the Falcons mobo.
Not like the good old ST.....

Hi James

>The 5 volt line is fine.

So the PSU is regulating

>The voltage accross the big smoothing cap was an expected 240v.

Do you have 220V mains, if so i'd want 280 - 320V here. If you do have
220V AC mains then substitute this CAP it sounds fishey.

>It just seems the 12 volt line isn't working do you know what i.c.
>regulates it?

There is no seperate regulation for the 12V rail so i'd start by
replacing the smoothing capacitors on that rail. Whilst youve got the
soldering iron going whip out the rectifier for the 12V rail and check
its resitance both ways.

>Soldering iron at the ready!!!

So whats the result?.

It seems to me even this old obsolete stuff out performs newer
systems in some areas. Mostly due to the compact code. I can
tell you from my experience with my Hades060, most of my day
to day tasks feel like "realtime", some things go so dam fast
now, you get the feeling it must of skipped the operation.
If a coldfire will out perform an 060, frankly that sounds
down right screaming fast even if it appears outdated
to the rest of the world. That's not to say I would not
love to see a PPC baesd mother board some day.

It was 1mb, I never could get the et4000 version of nvdi to
fully drive it. The Nova driver was always wedged in there
to kick the card to life. I was never happy with that arrangement
and had mixed results with various Nova driver versions. Ozk
has the card now. ;-)

No. 14Mb is the most the Falcon's crippled 030 can handle. You need a CT2,
Mighty Sonic or Afterburner to get more. If you can find someone stupid
enough to sell their Afterburner, buy it. It's worth every penny.

> from my understanding, the TT has a faster CPU than the falcon, in stock
> standard terms im talking, as for reliability, I think it would be just the
> same.

Yes, the TT's CPU is twice as fast, and from what I understand, the TT has a true 32-bit bus, while the Falcon still uses a 16-bit bus (although the manual states that it's a 32-bit computer? huh? oh well). However, the Falcon has a 32MHz DSP, which will make the Falcon run circles around the TT for software that makes use of it.

> but the falcon is used predominantly for music and graphics where as the TT
> for business applications.

Exactly. The TT's graphics and sound aren't quite as good, and the Falcon's DSP makes it much more capable of digital audio applications. Both, however, are equally as good for MIDI and DMA sound (great for MOD file composition/playing), if that's what you're into.

>> I can't find anything which really compares the two machines - I know
>> they are similar values, so which one is better (I'm using my Atari for
>> music, but I haven't made use of the Falcon's DSP especially - apart
>> from as a voice changer ;)).

What are your goals and interests for music with your computer? That would be the determining factor for which is best. If you're just into MIDI, and want more speed, and don't really care much about graphics (although the TT's graphics aren't horrible), then the TT might be good. But since you already aparently have a Falcon, my suggestion would be to keep it, and upgrade the speed of the system (get a 2nd hand Nemesis, CT2, or Afterburner, or wait for the Tempest or CT60, or get a DIY speed booster if you're into the technical side) For nearly the price of a used TT, you may be able to end up with a Falcon that's faster than a TT this way. I have a Nemesis on my Falcon, and it's very stable, very compatible, and when it does cause problems with certain software, I can just turn it off, and I'm back to the basic Falcon.

>> What are the fundamental differences in operation between them, and is
>> the TT any more reliable with software written for the ST such as
>> Explorer32?

Since both systems aren't the original ST, backward compatibility will be fairly low. As I haven't used a TT very much I can't be certain of this, but as the Falcon is actually based on the ST design and the TT is a separate design altogether, the Falcon would probably be more compatible. Use a

program like Backward for better compatibility (I've only found a very few programs that don't work with this).

The best solution is Motorola PPC. Forget Intel or Coldfire. All this cold fire stuff for Atari is already too slow, expensive, incompatible, and obsolete. Anyway why to use 160Mhz cpu when all macs and pcs run above 500mhz ? I would like to see a very stable machine with Magic OS. I am so sick of using Intel/Microsoft computer and see it crashing most of the time. I think the best and cheapest choice for Atari is to switch to PPC and go with that for now. I think if you can manage to punch out cheap Ataris (sub $1500) and make companies write some good software for it, Ataris would be nice alternative to pcs and macs. We would need nice Office applications like pcs and macs have so you could write stuff in your office on pc or mac and then take it home and continue with it on your Atari. If you make other standards it will just die out - nobody will buy it. And most of all, make the computer that could make use of some of the software already written for Falcons and ST.

Artur

Well, graphics and animation applications, too (just about any good graphics
software uses the DSP for decoding images).

> Define "business" ;-) The Falcon is much better suited for games, demos,
> graphics and sound in general. But the TT can have upto 256Mb RAM, and
> with a graphics card (Mario Becroft is selling his Galaxy card now I
> believe) it beats the Falcon easily when it comes to "serious" graphics.

While the Falcon can't directly use as much memory (unless you have an
Afterburner or CT2, or if you can wait for one of these other currently
developing accelerators to come out), it can use graphics cards (Nova,
Eclipse). So in basic forms, the Falcon's graphics is better. You really
can't compare an upgraded TT to a stock Falcon, since you could also just as
easily upgrade a Falcon.

Which program are you using? If you're using a demo of Videl Inside, it was
crippled to only allow you to use 16 color modes. Either register Videl
Inside (if that's still possible), or get Videlity (which is now free).
Either one of these will do what you need it to.

I think at one point, I heard about some memory card that was supposed to be
able to use the PDS slot for more than 14Mb. I think the CPU can only access
the standard ST-RAM slot up to 14Mb, but could access memory on the PDS in
much bigger chunks. I could be wrong though. This is just a vague memory of
something I read a long time ago and didn't give all that much attention to.

I think the Coldfire approach is good for now. At least the most interesting. How many desktops have been designed thus far running a Coldfire CPU? Probably not many if any at all. Be kinda neat to be the first or one of the only platforms to run this processor. And it looks good enough. The one they're planning on using is a 333Mhz now. That should cut it for most people.

I just think it would be fun to confuse my friends when they ask me what the hell type of computer is on my desk and I can say it's a Coldfire Atari clone.

And I don't think we should continually state that this system is nonsense or crap. Medusa computer has already produced two clones, so why shouldn't we believe them? And I hope the Tempest comes out too! Won't that be great when we see TOS running on three different CPU families! Good stuff!

Just my thoughts!

I got Connect working (just) then I tried HSModem with it (really hard to use) but I could only connect at 38400 and transfer files (it was a bit dodgy like this too, a number for CRC errors).

Non of the other speed rates matched with HyperTerminal (I know), I tried mix and match but non of them worked.

As for HSModem, I do not think it could have been made any harder to use even they tried, I used SCC on my TT, is that right? I did not understand why there was a MFP_TT as well, what is the difference?

In the Auto folder I have DRIVIN first and then SCC, is this the right order? should I load these after Magic and other programs (such as ExternGold, etc)?

I think I may make the cable.

OK, don't think I am picking sides or whatever just after an opinion.
Seeing as the 680x0 is not being produced and is very very quickly being
left behind (and getting very expensive), what CPU would you like to see the
'ST' migrate to?

As far as I can tell the options are PPC, Coldfire or Intel (8086 type
stuff), there are others (RISC stuff, etc) but I think these are the ones in
the general market and with a price tag the majority of us can afford.

What do people think the future is?

Mark.

>but it's nowhere near perfect - hence my reference to dialog boxes.

I've had several ideas over the years but they almost always
involve some bit of information that other stacks don't want to provide
easily or at all. Gets frustrating sometimes, but probably no big loss I
imagine more of them would have been crap solutions ;)

But I still have to say that the loading of the dialer app is
silly. At some point in time when the packet is floating around inside of
the stack it should realize that it has no external gateways and report
that back.

>
>I can also understand that you don't really want to support anything ...

>aware of in other peoples' messages and experiences.

Freeserve was STiK2 compatible, then they made some change to
their software and at least one person reported that they could not use it
anymore. Want to tell me what HOSTNAME does? I very much have tunnel
concentration ;) Ask me about a subject I'm currently working on and I
can give you answers to all sorts of odd questions that you might throw at
me. Ask me about one that I am not at the moment working on and I draw a
blank on the simplest of questions. By not working on I don't want to
start rumours about software development being stopped, I just mean that I
generally am working on 6 or more programs at the same time. However I
rarely am actively working on more than 2 at the same time unless they are
related developments. Active development projects are based on desire,

need demand etc and usually go for a week or two at a time until I run into some wall. I found years ago that when I run into a wall it is better for me to take a break on that project and work on something else for awhile. The reason for this is I've found that what looks like a complex problem one day and I could spend days trying to find a solution for, often becomes a 5 minute fix a few weeks later when I've had a break from the project. This is why my developments seem to go in fits and starts and seem to be all over the place.

This in away is also why you haven't seen such things as a BoinkOut2 with DMA sound. My sound routines broke when I switched from Lattice C to PureC. Every once in awhile when I feel the desire I take a few days and work at it. It is something I really want to have (working sound routines that work with my compiler) but don't have a general every day need for. Other projects out there are like this. I've spent quite a bit of time on getting an Iconnect version of the Ataricq OVL working. All with no success, there is some fundamental difference in how it handles UDP when compared to BSD sockets (MiNT Net) and the STiK API (STiK/STING/GlueSTiK). The first initial port to MiNT Net took me a few minutes, then we needed some input from people that use it everyday to get it working better. In comparison, I've personally spent hours on an Iconnect version and have never been able to progress beyond the remote end seemingly sending me jibberish. I will take another look at it I'm sure but for the moment it's on hold behind some other things I have queued up.

Well that's probably enough blathering on for one day ;)

1342. Re: Displaying .JPG files

Newsgroup: comp.sys.atari.st
Date: 2001-01-26 03:53:18 UTC
From: taj16@dreamscape.com
Message-ID: <t71t5eo85cp5a9@corp.supernews.com>
Source record: 51177

A while back I posted this question:

>Photochrome 4 does a superlative job of displaying GIF files on my Mega STE
>(as long as I remember to slow down to 8MHz). Is there a program somwhere
>that does an equivalent job with .JPG files? Or, failing that, is there a
>JPG->GIF converter? I've tried viewing JPGs with CAB 2.7, and it just
>doesn't measure up.
>

I received several suggestions, and I thank you for all of them. However, I now must sheepishly admit I may have had what I needed all along.

My first ST was a 1040STf purchased at a garage sale in 1995. I had it for six or seven months before lightning took it out, just as I was starting to know what I was doing. During that time I did quite a bit of downloading from the local ACE of Syracuse Backstairs BBS. Most of that stuff was put away, forgotten, when I lost the ST.

A few days ago I dug out what was left and looked it over. I found a file named JPG668.LZH, which contained but a single file, JPG68000.CPX. This CPX is supposed to convert JPG files to GIF, TGA, or PPM formats, and it appears it should convert those formats to JPG. too. The info dialog box says it was copyrighted in 1994 by Andrew L. Young. I have no information about whether it was originally freeware or shareware. I'm assuming it was freeware, since there were no docs with it.

I tried it out last night on three JPGs I had handy. Two had been downloaded from a friend's website, the products of some experimentation with a new digital camera. All three converted successfully to 256-color GIF and displayed beautifully with PhotoChrome 4 and Picswitch 1.01. The only TGA conversion I tried would not display with Photochrome 4. The PPM extension is new to me and I don't believe I have a program that will display it, so I couldn't test that. The GIF format will be the most useful to me, anyway-so I'm very happy (so far).

Has anybody seen this CPX on the 'net anywhere? It really deserves to be where people can get at it.

Doesn't work either on my machine. Didn't really think it would since
it didn't work with my original par file.
So it seems I should try to dig out my spare falcon sometime and try
if it works on that.

1349. denoiser question

Newsgroup: comp.sys.atari.st
Date: 2001-01-26 11:06:10 UTC
From: Janka Gerhard <gerhard.janka@siemens.at>
Message-ID: <3A715A22.28AA48D7@siemens.at>
Source record: 51184

Hi,

Some time ago I bought the soundpool denoiser program. I hoped to be able to enhance sound quality with it when I transfer some of my old audio tapes to CD.

The problem is that when denoiser subtracts the noise the result has another kind of noise in it, kind of 'clicking, clanking' sounds which makes it worse than the original sample.
Maybe this is because one has to mark some quiet passages (containing only the noise to be subtracted) and I found no way to be sure I really set the markers right (unfortunately the interface is not as easy as at audiomaster). But as it is I'm not sure whether the bad results are my fault or denoisers fault or somehow my hardware causes the problems (which is the least probable reason I think).

So I would be happy to hear the experiences of others or even some tips what I could have done wrong (better my fault than that of the software).

Thanks
Gerhard

1350. WTB: ST dev. system, book recommendations?

Newsgroup: comp.sys.atari.st

Message-ID: <Xns9035421326E3Fdangelprrcom@207.250.5.3>
Source record: 51186

Hello,

I am still looking to get an ST of some sort for a little project I need to work on (I've posted here before) It needs two things, really -- a hard drive (size doesn't matter) and an SVGA monitor adapter. I know next to squat about STs at this point, but I'm a decent programmer on other platforms and would like to implement my midi-sequencer idea. (It's quite a far cry from the existing sequencers, which I despise) Some development software could help, but I think I might be able to acquire that on my own (already have an assembler and a C compiler on the way).

Also, does anyone have any recommendations on books that are must-have for TOS/GEM programming? Already I've got the following in transit:

Compute's Atari ST Programmer's Guide
Atari ST Machine Language
Compute's Technical Reference Guide
Atari ST Graphics and Sound
C Language for the Atari ST

thanks,
-dan

1351. Re: Good news about Coldfire clone

Newsgroup: comp.sys.atari.st
Date: 2001-01-26 12:54:11 UTC
From: Richard Kilpatrick <richard@lovecraft.demon.co.uk>
Message-ID: <Vf9zhkUzNXc6EwiQ@lovecraft.demon.co.uk>
Source record: 51187

Once upon a time <980510799.7526.0.nnrp-13.9e98a620@news.demon.co.uk>,
Mark <mark@recycledsteel.co.uk> grabbed chalk and scrawled:
>'TOS' (in the broadest of senses) is becoming much more 'open source' and
>more like Linux is (ie no real platform base as such just a good portable
>OS), is this what we want?

This is what happened to BeOS, and this is why I really don't see the
point in all the clones beyond a tiny market - more like someone
designing something because they have the skills to, rather than trying
to keep the /Atari/ platform alive.

I mean, you have two reasons for wanting a computer - either to perform
a specific or number of tasks, or to run existing software. IMO, the
strongest market for the Atari is for people who have existing
specialist software, and even Atari couldn't make their own similar
architecture machines 100% compatible.

When Be released the BeBox, it was competitive, clever technology with a
smart new OS. Everything was beautifully integrated, you had dual
processors, MIDI, sound, a machine which looked smart. It was also not
expensive.

When I see Atari clones online, they are frequently kludged, starting as
a motherboard and having various interfaces hung off them to try and
provide the functionality of a TT or whatever. I very much doubt that
they are compatible with a lot of the software, and of course new
software isn't exactly a commercial viability.

If there will be a Coldfire based machine, then great, but where is the
'clone' aspect? It's just another new motherboard that can maybe run a
few MagiC or TOS applications. Hades/Milan at least have fundamental TOS
compatibility and a 680X0 architecture - and the 68060 is a curiosity,
too.

If someone wants to build an Atari clone, for crying out loud, build a
/clone/. From dealers, TTs and Falcons are ï¿½450. Surely you could build
a new machine for that, incorporating some of the patches. Say a TT with
a DSP, and Cubase patches applied to the audio stage. The skills are
there, and this would be a genuinely useful machine, and you could call
it an Atari. The only problem I can see is a lack of Videl and since
there is the technology in the CrazyDots cards, which sounds more stable
anyway and has it's own VRAM, then there isn't an issue.

I'll keep saying it. Make a 32MHz 68030, 32-Bit Atari clone with DSP and
good board design, incorporate a second MIDI channel or at least ensure
it is fully compatible with existing equipment, and give it a proper

Thru port, /make sure it's stable/ and sell it for ï¿½500 in a rackmount case (or a case that can be rackmounted by adding 'ears').

It has to be able to run Falcon DSP apps and ST MIDI apps. Then your market is guaranteed. I've seen the kludges for making Falcons more stable, for adding memory to the TT, for increasing the bus speed of the Falcon, so I know that the knowledge and experience is out there.

Richard

Well if the Coldfire is like the 68000 series, then the 333mhz speed would
be a much greater equivalent when you compare it to the Pentium. Like my
Hades 68060 runs at 60mhz, but that is euivalent to a 200-400mhz Pentium
depending on what you are running.

>I would
>like to see a very stable machine with Magic OS. I am so sick of using

I believe that is coming for existing 68030 machines and above. It is
called Destiny and will offer a PPC cpu. This will actually turn an Atari
computer into a two-cpu system.

Forgot aboput Magic. But doesn't Magic run as an emulator on the
Intel at least? Not quite the same, but sorta. That gets back into
the arguments about emulation.

How does MagicMAC work? Does it take over OS functions from MacOS?
I'm just interested.

Sounds good to me! If I could walk to the store and get an Intel
motherboard that runs TOS natively, that'd be fine with me. Although
I know how a lot of people here hate the Intel machines ;-)

Isn't this similar to the Falcon clone Wizztronics was considering? I
thought they were making a relatively slow clone, but would be Falcon
compatible. I'm not sure.

>Interesting. So am I the only falcon owner where that version of
>GTLOOK doesn't work ?
No, you're not the only one. I know a couple of people that (used) to have
similar problems. In all but one case the problem was connected with the
memory expansion, when using a different SIMM it worked... one guy used the
original Atari 14Mb expansion, he never got GTLook 2.03 working. Another guy
couldn't get it working on his TT, but after removing the Riebl network card
he reported that it was OK (?)

If it's any comfort.. I know two Falcon owners who can't run GTLook at all,
no matter what version they use... so count yourself lucky :-)

Cheers from Belgium

>You can count me in. Having hand assembled a Hades060, perhaps
>the only one in the US to do so, I for one think the lastest
>news release sounds positive at any rate.
The latest news? you mean that bit where they annouce that it will not be ready in april, but has been put on hold for at least 8 months? or that other bit where they state that the Coldfire 4e is 100% 680x0 compatible? Even Motorola isn't aware of that!

In fact they've added more bullshit...
"the eight months will not be lost because in the mean time programmers can start developing drivers and adapt their programs". I've had to read this statement a couple of times, because I thought it was some German humour at it's very best, but these people are bloody serious!

>Just like you I have a Falcon, TT030, and a Hades060 all in the same room.
>If I had yet another even more powerful clone sitting next to these, why
>not?
Because it's the odd one out...
The Pegasus is not a clone, but a desktop computer based around a Coldfire running TOS under emulation.
The Hades and Milan both have a patched TOS, but these patches were made to make TOS aware of PCI.. etc. The Pegasus TOS will need to run under several emulation layers and be so heavily patched that one can hardly talk of a "Atari clone" anymore. Is an Apple running MagiCMac a Atari clone?

>I think some very interesting things coming for MiNT would make such a
>machine quite very nice to have.
I doubt that MiNT will even run on such a machine, Freddi Aschwanden wasn't really sure either. If he isn't sure then why do you think that MiNT will run on it? Recompiling it will not be enough...

Cheers from Belgium

You'll have to wait for a TT expert to come along for that one - but you'd run drvin.prg plus whatever supplementary driver is required at the end of your auto folder, but just before stacks such as sting.prg or sockets.prg.

>I think I may make the cable.

It's much faster.

From: Odd Skancke <oskancke@online.no>
Date: Wed, 24 Jan 2001 04:21:36 +0100

Hi Odd,

> Then you, Sven and Uwe and I have different opinions.
3:1... you're outnumbered :-)
TBH: Sven never said it was nonsense, he merely pointed out that because of the to be used emulation layers and the very heavy patching that would need to be applied, the Coldfire design would hardly be faster then a Milan-1, this is not exactly 3X faster then a Hades 060 is it?
I think Uwe has different reasons to call it nonsense, the way the project is presented is enough to make anyone think twice...

> If such a machine actually became available, do you think existing
>software authors would let it go without their software?
Frankly... yes.
Where's the support for your Hades, where's the support for the Milan? and what makes you think that it would be any different now? Unless the Pegasus can run unpatched applications it has no chance...
Remember when the Milan-1 was lounched? On paper it offered everything the average Atari user could possibly want. But the authors didn't share that enthousiasm, I've still got to see the first Milan application appear...
I can understand that commercial authors have reservations, but what about the "free" market? One could argue that the Milan-1 is a MiNT computer, it comes with MiNT/N.AES as standard OS, the MiNT platform never had a better opportunity to promote the OS, but even the MiNT developers didn't want to know about it.... except for some serial drivers nothing happened.

Three years on... with an ever shrinking number of authors some German clowns hope to attract a *lot* of talented programmers to get their crazy design working, that's pure nonsense or to put it bluntly: bullshit :-)

Cheers from Belgium

>imagine more of them would have been crap solutions ;)

I doubt that! :-)

I thought something quick and dirty - look in the cookie jar to see if
there's a stack loaded. No stack, so load from disk. Can't be that easy
though :-(

>Freeserve was STiK2 compatible, then they made some change to
>their software and at least one person reported that they could not use it
>anymore. Want to tell me what HOSTNAME does? I very much have tunnel

It used to work with IConnect as well - as to what Hostname is, I haven't
the faintest notion I'm afraid :-(

I think that Freeserve also force VJ compression as well - that's something
which STinG can also deal with.

>into some wall. I found years ago that when I run into a wall it is
>better for me to take a break on that project and work on something else

AKA "sleeping on it". Works for me as well :-)

I always thought that the 030 wasthe full version but the DRAM
contoller limited it to accessing only the 14Mb. Similar to the ST.
What about the Blowup FX, that never replaced the CPU, I think.

It's possible that one could use bankswitching or something similar, and
use the MMU to map this to the physical address space. It wouldn't be
particulary efficient though, and I don't think something like this
actually has been made.

The TT has both the MFP chip that St's contained and the SCC chip
that the Falcon contains. Serial2 is on the SCC chip it does a standard
serial port up to 230kbs dte rate. The MFP controlled ports are limited
in their compatible dte rates. You can find the details around on the net
but basically somewhere after 38400 they start having strange
synchronisations that don't match up with any real devices.

Hi all,

I'm trying to get these to work together on a 4Mb STe. I've got them connected via the printer port. There doesn't seem to be an option to external sync on the SMPTE page. Only a few things match with what it says in the manual which is for Pro 24. I've only got Internal or MTC. The other settings have Int, Atari, MROS, Xport 1-3, none of these do anything. Does this only work with Pro 24? I believe Pro is free now, where can I get it?

Hmmmm, Magic already runs on 3 different platforms but another is good. I would like to see 'us' migrate down the PPC too as I am unsure as to how far Motorola will take the Coldfire, don't get me wrong though I will be banging at their doors the day Medusa have some in stock.

'TOS' (in the broadest of senses) is becoming much more 'open source' and more like Linux is (ie no real platform base as such just a good portable OS), is this what we want?

Mark

> I believe that is coming for existing 68030 machines and above. It is
> called Destiny and will offer a PPC cpu. This will actually turn an Atari
> computer into a two-cpu system.

Not to be picky, but it's actually Tempest you're speaking of. Destiny is just an adapter board that lets you use Falcon PDS cards on TT's and compatibles. You could then plug in cards like Tempest, Eclipse, etc. into these machines. You'd need to buy both Destiny and Tempest in order to have the PPC CPU on a TT or Hades/Medusa/Milan machine. Falcons just need Tempest.

Some interesting angles on the situation, however are you
aware that a video card in a TT more or less turns it into
a GEM box? Once the video is redirected to the video card you
can run only well behaved GEM apps that also use the VDI
correctly. Some where the paltform has to give, and this
is one of those areas since no one will ever update the
the shifter or videl. Either you get a clone or you live with
an old machine. If you are lucky something like tempest might
be a nice halfway point.

I have had a TT for years with a gfx card, I can tell you
from my own use the gfx card really puts limits on what you can and
cannot run. Since I was used to that arrangement, the Hades
seemed like a logical step, I run the same stuff as I did.
For me the 060 is not an oddity anymore, it's an everyday
thing, and worth every penny.

I wish the situation was better, but the computer industry itself
is so messed up, that it's hard to do anthing "the right way"
anymore.

Have you tried editing the .INF files? I'm not familiar with Cubase, but
surely these modules have resource files they're looking for. Perhaps
they aren't aware of the HD...

I'm no TT expert, but MFP_TT is for the 19,200bps compatible port that
is driven by the MFP like in the old STs. SCC is for the two ports
driven by the SCC, the LAN and Serial/Modem 2. I have no Idea how
this are presented socket wise on the back of a TT. Put both in after
driven.prg and you'll be safe.

> Even Motorola isn't aware of that!

The 8 months to me is great new, as that means they will wait for 4e to become available. I agree with it being a hopeless project using non-pmmu/fpu version of the ColdFire. Who knows, perhaps the new 4e core is more compatible than we know.. anyone actually seen the detailed instruction set of this new core? I've noticed that more and more have been put back into the instruction-set since v2 of the core, so who knows .. perhaps they add more to make it easier to run existing Linux-based embedded stuff currently running on real m68k's....

>

Why do you find this funny? If I was actually sure the machine would appear in 8 months, I would start modifying my coding habbits immediately, but since I don't really believe that just yet, I'll wait and see. But that does not mean I think the statement is bullshit. I think your attitude is bullshit! Afraid MagiC wont run on it?

Not only that, TOS won't run on 040/060, because those does not implement
all 030 instructions! This means that Milan/Hades TOS had to be patched
(totally rewritten in Milan's case, but not only because of this) to run
effectively on 040/060. Ofcourse, the 040/060 can emulated this completely
using unimplemented integer/fpu instructions handler...

I will personally make sure MiNT runs on this machine, if it becomes
available. Thats why I'm so concerned it MUST have a pmmu. Ofcourse
recompiling isn't enuff, but one have the full source, so making it work
is not hard.

Support for Hades/Milan is good, from the remaining programmers in the
community. CAB is a dead-end, I agree, but then again, we've got XGEM so
we can soon run netscape on Atari.. under MiNT ofcourse. Now, (addressing
software authors now) are there any software authors that would not try to
make their software work on such a powerful machine, without having to
emulate 68k?

> Remember when the Milan-1 was lounched? On paper it offered everything the
> average Atari user could possibly want. But the authors didn't share that
> enthousiasm, I've still got to see the first Milan application appear...

Well, I can't tell you if there are any Milan-specific applications, but
there are Milan-specific drivers, which drive sound/scsii/etc.
MilanBlaster anyone? Altho it is hardly "applications" in that sense, they
help existing applications work on the new Hardware. Ever used Papyrus on
a bog-standard Falcon editing real heavy documents? I think the speed of
the Hades/Milan is enuff to call Papyrus a "clones application" ;-)

> I can understand that commercial authors have reservations, but what about

Hi!

For some reasons CixRead crashes when I try and reply direct with a
'com' so I am trying a 'say':

In message <e5A1KUAeuNb6EwYa@my-ste.demon.co.uk>, nospam@my-ste.demon.co.uk said:

>All this goes to show that LFNs are stored in the directory sectors along
>with their 8+3 equivalents.

Thanks! A bit clearer now. I don't understand why there are variable
gaps in the LFN character bytes, though. Also, what happens when you
switch LFNs on or off temporarily - I presume than when switched off,
any new file saved will only have 8+3 but the LFNs for others will still
be there, and recoveable by switching LFNs on again.

If you ask why I just don't enable LFNs on all partitions, the answer is
that Kobold 3.5 is *much* slower in copying these, having to do it in
GEMDOS mode if either source or destination has LFNs enabled. But I have
LFNs on B and not A, so I'll try saving a few files to both and then
having a look with Harlekin's Monitor.

Regards, /Peter/

Hi friends:

Is there a trick to run MagicMac on a PowerMac?

I was able to run it on sys 7.6 but now does not run on sys 8.6
and it says something in German about page size 4096.

Any one using this program please let me know of any possible
solution.

Thanks! Raymond

Latest release of MagiCMac runs fine on MacOS 8.5, 8.6, 9.0.4 but not in
the moment on OS 9.1. I remember my of an update for OS 8.x some time..
(But ii¿½m not sure)

Try the latestes demo.

>OK, don't think I am picking sides or whatever just after an opinion.
>Seeing as the 680x0 is not being produced and is very very quickly being
>left behind (and getting very expensive)
It doesn't really matter that the 680x0 isn't produced anymore, it's not like there's a need for 100.000 of them. If a new clone would be produced and 2.000 units of these would be build and sold, it would be an *enormous* success.

>what CPU would you like to see the 'ST' migrate to?
To nothing... the ST doesn't have to migrate at all, the 68060 and even the 68040 will do nicely. In this newsgroup the majority of the people are using a Falcon or TT, both 68030 based. Most don't even have a clue what the term fast graphics is all about, since they don't have a graphic card installed. I find it hard to grasp that people who never seen a 68060 in action dismiss it purely on the basis that a PPC or Coldfire *could* be faster.
What software do you use that needs to run at "three times" the speed of a Hades 060? except for some raytracing stuff I can't really think of anything that would benefit...

>As far as I can tell the options are PPC, Coldfire or Intel (8086 type
>stuff), there are others (RISC stuff, etc) but I think these are the ones
>in the general market and with a price tag the majority of us can afford.
This is a joke right? the Coldfire isn't exactly a processor of which I would say it's "in the general market".

Cheers from Belgium
Dennis

The support for the Hades is out there, it is just not in the amount that I would like it to be. Sometimes it is frustrating like Odd's soundcard driver. It is does not work fully for myself and other Hades owners who bought the Hades when it came out. It seems to work on the models released in the last 1-2 years. I do not blame it on Odd at all, I appreciated his effort and other like him who have written Hades-only programs. I would think this new computer should be able to run applications from other platforms like Linux, PC and Mac. That is what I was hoping for when I bought my machine. Still, I am very happy with it.

On a regular ST with a regular OS like TOS, the maximum partition size that can be read is 500mb. Is there only 1 partition on the 1gb drive? If that is so, an OS like Magic should be able to read it with no problems.

Yes, that is picky (g), but you are correct. I realized that after I sent
the reply. I think everyone understood just what I meant.

Compatibility is all and well, but who would want to buy a brand new
32Mhz TOS-computer? Why develop a new computer with specs that would
make the thing end up so outdated already at the day of its release?
IMHO if someone bothers to develop a new board, it would have to be
something with a lot more power than a 030 at 32Mhz.

And as previously mentioned, if a new tos-comptuter would actually
against all odds hit the market again, don�t you think the ones
producing software would be interested in supporting it?

Finally, I have no idea if this computer will acutally be available one
day, but unlike others I will not insist on convincing the rest of the
world it will fail miserably. I wish Medusa all the best with the
project,and since it seems like it is the only clone in progress, it is
pretty much all we have left to hope for, even if details are vague and
project is not presented in the most professional way...

Just my 2 cents..

/Joakim

1990 GMC Extended Cab 2 wheel drive Pick Up Truck $5,000
Red & Black in color
Kelly Blue Book Retail price lists for $6,120 without warranties for near new tires & battery, BackUp Warning Beeper, Burglar Alarm/Remote Door Locks and Shop Manuals.

This little used truck has less than 50,000 original miles and has been faithfully serviced by Bill Copps, the dealer who sold it to me. The dated service records are included for your reference.

Equipment includes:
Owner's & Shop Manuals
Clifford Burglar/Remote Door Locks Manual
Recently new tires with Transferable Les Schwab Warranty Contract
Recently new battery with Transferable Les Schwab Warranty Contract

4.3L V-6 engine
Automatic Transmission
Digital Instrument Panel
Air Conditioning
Cruise Control
Power Brakes
Power Stering
Tilt Steering Wheel
Rear Side Swing-Out Windows
Vanity Mirror on Passenger Visor
AM/FM Radio with Cassette Tape Deck
Power Door Locks with Remote
Power Windows
Back Jump Seats with Safety Belts
Clifford Burglar Alarm
BackUp Lights
BackUp Warning Beeper
Rear Bumper with Trailer Ball
Bed Liner

I'm retired and no longer have a need for this truck.

I've got two SCSI hard drives, a 540 mb and a 1.1 gig. One has an Adaptic card and the other has a Link II. Both have tape drives in them and I've got 9 tapes for them. Also, I've got a Monitor Master that I've modified to switch the AC along with the monitor signalling. Lots of software and maybe some cords and stuff.

Here's the deal. Its FREE to who ever comes and gets it AND brings along a working ST, monitor and mouse so I can delete some personal files.

If you really feel you must pay me for this I'll take your money but its FREE! (But the tapes and drives need some erasing).

The 1.1 gig drive was used on the Bear Cavern BBS and contain thousands of files which you can have, just not the personal files.

The problem with these chips is their price. If you can find any expect to
pay $$$ for them. Ask Rodolphe Czuba or Sven Karlsson (or the Milan people
for that matter) how eazy it is to find these chips for a reasonable
price...

Indeed. Why would one even need a Hades060? A TT with some TT-RAM is more
than enough. Or a 14Mb Falcon, which should cover all our needs.

I don't understand what you're trying to say here... Is Milan-only
applications what you want? Why? Modern applications and games use the OS
and not the hardware. Graphics editors will benefit from accelerated
graphics cards (and not only on the Milan, and not only one specific brand
and model), but won't *need* them, only run a lot slower on old hardware.

Sound applications will perform better with a modern sound card on a Milan
or Hades than on a plain Falcon, but it will work on both. Word processors
will run faster, thus utilizing the faster CPU. Games like Doom or Quake
will benefit from faster graphics and a faster CPU, but will still work on
a Falcon.

Why is this a bad thing?

Once upon a time <94uq00tlp1@nnrp1.deja.com>, Joakim Hï¿½gberg
<gokmase@my-deja.com> grabbed chalk and scrawled:

>Compatibility is all and well, but who would want to buy a brand new
>32Mhz TOS-computer?

People who have realised that a 32MHz TOS computer did exactly what they
wanted 10 years ago, and still want to do the same things. Why do you
think so many Ataris are floating around, and why in music circles, an
ST is considered worth up to ï¿½180, and Falcon/TTs up to ï¿½450? What is an
equivalent Amiga worth? ï¿½20? Maybe, just maybe, ï¿½100 for an A4000 or
something similar?

>Why develop a new computer with specs that would
>make the thing end up so outdated already at the day of its release?

Why develop another computer at all, when there are PCs/Macs already
saturating the market? The Atari had a niche where it is still extremely
popular.

>And as previously mentioned, if a new tos-comptuter would actually
>against all odds hit the market again, donï¿½t you think the ones
>producing software would be interested in supporting it?

A new TOS-based machine with no compatability, or the machine I'd like
to see?

I think that many talented programmers worked in the Atari MIDI field,
and they still exist but as the computer died off with the last Falcons,
the real market for software followed. I suspect that if a simple
solution existed that musicians could buy and use, then the Atari
programmers would adopt it as these musicians would obviously buy
software.

I don't think something like a Coldfire based clone would. It doesn't
attract consumers, it attracts enthusiasts. Enthusiasts don't really buy
that much software, because part of the appeal of these clones is that
they're a new toy to tweak - for those of use for whom the task is
primary, the technology secondary, clones make bugger all sense, as the
task time is spent faffing around making the software work, and the
technology side is (usually) more expensive than a PC of equivalent
power.

>Finally, I have no idea if this computer will acutally be available one

I don't want to see it fail any more than I'd want to see a new games system, or a new car brand, or a new flavour of coffee fail. One, I don't gain anything from the failure, and I am interested in the technology.

However, I simply don't see it being a success. I might consider investing in a new games platform (if I'd had a lobotomy or Sony went bust), a new brand of car, or a new coffee producer, but not in any company making some leftfield computer system with no intellectual property as equity. Be at least had BeOS, with some new ideas, and FWIW the BeBox was a good system. The sad thing is, these clones all trade on someone else's intellectual property, there is no innovation beyond the idea of putting /that/ CPU and /this/ old OS and /this/ load of OS patches together, and in that case, they need a cast iron market first - like, say, music.

No, I didn't actually know how the expansion handled the video...

>Once the video is redirected to the video card you
>can run only well behaved GEM apps that also use the VDI
>correctly. Some where the paltform has to give, and this
>is one of those areas since no one will ever update the
>the shifter or videl.

In some ways, Videl is adequate, but I'm thinking in terms of backwards
compatability as a stop gap. How about - :

The OS can't switch resolutions on the fly anyway. Maybe later updates
can, but the Falcon can't, and nothing before that can as far as I know.
Why not have a shifter, videl and some form of enhanced graphics for new
apps that can use them, and make /less/ of a thing of being able to
change - essentially, choose a new mode and the computer reboots, but
because TOS is in ROM (and perhaps a couple of basic apps, too, since we
can have Flash ROM now), the reboot isn't as noticeable as it was on
Windows 95.

The largest problems with apps are colour depth, rather than pixel
resolution. I find many good GEM apps don't have the resources to handle
16 or 256 colours, but otherwise work fine. IMO, this shouldn't be too
hard to fix, either by updating the software, or by writing a smart
patch into the OS that can change colour depth on the fly.

>I have had a TT for years with a gfx card, I can tell you
>from my own use the gfx card really puts limits on what you can and
>cannot run. Since I was used to that arrangement, the Hades
>seemed like a logical step, I run the same stuff as I did.
>For me the 060 is not an oddity anymore, it's an everyday
>thing, and worth every penny.

nods It depends on how much data you've acquired, in what apps, how
dependent/loyal to your platform (or at least, the apps that you are
using) as to whether something like that is a benefit. As you said, what
about Tempest?

I don't like those ideas because they're a patch on a patch (still
thinking of the CT60, though a big part of that is that I can always

remove it). Something like the Falcon needs to be taken back to design stage, the couple of errors like the address bus width need fixing, and then it can be left to it's own devices.

>I wish the situation was better, but the computer industry itself
>is so messed up, that it's hard to do anthing "the right way"
>anymore.

Which is why I think that this idea would work. There /are/ hardware issues, but I think resolving the issues first would make for a product that perhaps wasn't cutting edge technology, but also was accessible (since a Hades is ï¿½1,500, and to the consumer has no real advantages, I don't consider that accessible).

I'm serious. I really would buy the machine I'm attempting to describe.

Yes. However, if there is to be any kind of future for Atari clones, what
will happen when there are no more 680x0's left, even if that is far in the
future? We will be forced to either switch to a different CPU anyway, or
just give up. Wouldn't it be easier to start the transition now, while we
still have options?

> fast graphics is all about, since they don't have a graphic card installed.
> I find it hard to grasp that people who never seen a 68060 in action dismiss
> it purely on the basis that a PPC or Coldfire *could* be faster.

Faster, cheaper, currently produced and supported, constantly being
improved, etc. Yes, I would find all these to be very good reasons to switch
to Coldfire or PPC (preferably). I have a Falcon, and I know exactly how
dead slow it is. At one point, the 68030 in the Falcon seemed nice and
speedy, compared to my ST, and my ST seemed speedy compared to my 1200XL.
What happens when we all finally get around to using 68040's and 060's as
our 68000's and 68030 eventually die or get replaced? Eventually software
will meet the limits of these CPU's as well.

> What software do you use that needs to run at "three times" the speed of a
> Hades 060? except for some raytracing stuff I can't really think of anything
> that would benefit...

That's because most software is designed to run happily on 68000's and
030's. There are pieces of software slowly being developed that take
advantage of the 68040 and 68060, because these machines exist. When we all
catch up to this point, software will once again push the limits and we'll
feel once again that our machines are too slow for modern applications. The
way I see it working, is that we grow into the CPU's we have, no matter what
their speed, and eventually *any* CPU will become too slow. An example of
software that we can't use because of lack of CPU speed is Java

applications. More and more web sites are using them, and if we are going to stay online with our machines, we will have to be able to use Java at some point. 68060's are way too slow to make this really usable. My G3 Mac even slows down quite a bit to run Java apps.

>> As far as I can tell the options are PPC, Coldfire or Intel (8086 type
>> stuff), there are others (RISC stuff, etc) but I think these are the ones
>> in the general market and with a price tag the majority of us can afford.
> This is a joke right? the Coldfire isn't exactly a processor of which I
> would say it's "in the general market".

I would agree. However, if you change "in the general market" to read "in production, and widely available compared to 680x0's", then it makes perfect sense.

Basically, my point is that we do too much settling for 2nd best. Over the years, I've always heard in this group, "we'll never need X, we can do just fine with Y because it suites our current need just fine", and then a year or two later, everyone is complaining because Y won't do what they need done and we have to struggle along with Y while the developers try to implement X. Meanwhile Z comes out, and we say, "we'll never need Z, we can do just fine with X..." etc. I hate that! An example of this mentality is with Javascript and Java. A few years ago, I was reading the arguments about that saying, "Java/Javascript (there was no mention of the difference at the time) is just used for flashy extras. There's no need to push for a Java/Javascript-compatible browser." And now we're running into more and more web sites that won't allow you on them unless you have Javascript enabled. It's the same with CPU's. If we say, "we'll never need that much speed," we'll eventually hit a brick wall and struggle to catch up to 2nd best again.

>hit the slow motion button somewhere along the line...

As on my machine I only can make Cab working with Iconnect and MiNT I
can only share you my experience with Cab and Iconnect. If I've the luck
Cab will go up to 2.500 cps when I use Iconnect. With MiNT-net Cab
usualy doesn't go under the 4.000 cps.

My phone line isn't good. In order to get a stable connection I must
tune down the modem speed to 42.000 bps. Even then downloading stuff
from the ftp-servers using wget for instance happens usualy with 4200
bps.

1410. Re: Need help with Supra hard drive

Newsgroup: comp.sys.atari.st
Date: 2001-01-27 22:16:56 UTC
From: "Ralph E. Dodd" <redodd@home.com>
Message-ID: <sNHc6.181171$w35.33014628@news1.rdc1.nj.home.com>
Source record: 51142

Mark,

A gentleman named Don emailed me the original Supra software.
I found out that the 20 meg Miniscribe 8425S drive wasn't spinning
due to stiction or else the brake was stuck. It slows down quickly
so I think that it's got a brake system. Once I got it spinning, no files
were found so I tried to format it. It went through the format routine
fine until it reached the inner tracks of the disk and then gave a hard
disk error. I tried this many times with the same result. Now I figured
I would try a bigger drive like many from this group have suggested.
I tried a Seagate ST1480N, an HP C2235, and many Quantum drives
(40,80,160Meg). The controller doesn't see any of these drives. I set
the SCSI id to 0 (like the Miniscribe was), turned parity on and off,
tried every type of termination setup but none of the drives were
recognized.
If I put the Miniscribe back, the controller sees it but the drive won't
format.
All of the drives that I've tried are SCSI II. I've been told that they
should
work with what I assume to be a SCSI I controller in the Supra box. I got
another 20Meg Miniscribe drive on ebay which I should get in about a week.
Do you have any tips on how to get any of these bigger drives to work.
These are all good working drives. Thanks a lot.

Ralph

1411. keyboard for Milan

Newsgroup: comp.sys.atari.st
Date: 2001-01-27 22:46:04 UTC
From: rking@zetnet.co.uk
Message-ID: <3a734fac$0$179@news.zetnet.co.uk>
Source record: 51143

Hi All,

Some time ago I mentioned a fault (1s repeating whenever I touched it) on my Milan Keyboard, an NEC. I mentioned this to the service guy in a small computer service shop. 'Oh that's always happening, its your membrane breaking down'. He then went on to describe other symtoms. So I bought a Genius keyboard for
£11.00. Fault cured, much better tactile keys AND a wrist and palm rest. Point of message is to show an often forgotten advantage of Milan --- it's use of standard PC parts. He was able to show me some SCSI cards with the correct chip set, but a bit pricy, so I'll shop around a bit!!

BTW anyone know a program to make the Caps and Num lock LEDs light up, they do work when the keyboard is polled at boot.

Bob King.

I think there would be no need. The Videl is a great chip, as proven
by CENTscreen and Videlity. You can throw whatever resoultion at it
and it seems to get on fine. All you'd have to do is to clone it with
a faster logic speed core, and give it some nice clock of around
64-100Mhz. should easily do big resolutions. This can be possible in
a Falcon, but the CPU is just too slow to process the huge amounts of
data.

> become black (i.e. different shades in the colour icon will all become
> black), which is fine by me.
> I've tried to copy the icon, move to the black/white part then "paste",
> but no go.
> How do I do this without manually having to re-draw the icon?

My method to convert color icons to B&W:

- Save color icon as IMG.

- Save the mask as ICN.

- Convert the IMG to B&W with Graftool (Floyd-Steinberger is the best).

- Edit B&W icon: load B&W IMG then the mask. (FS produced very irregular
outlines for which it's very tricky to create a mask.)

- Et voilï¿½!

I mentionned Graftool because it's the only program I know that enables you to
convert images to any color depth without needing to have this resolution on
screen.

You can also use PixArt, for example, or any graphical program but, this time,
you'll need to switch to monochrom then back to color, once the IMGs are
converted.

Hope it helps.

See ya,

hops
This is why I've got my Atari - if it interests you, please have a
listen to the first song I ever recorded, though not using the Atari (it
was 3 years ago).

http://www.mp3.com/RichardKilpatrick

I'm working on new songs, which /are/ recorded using an Atari Falcon
(and may even feature Falcon sounds, depending on what happens!). I'd
like feedback, whilst I work on more stuff.

This is my first song to MP3, it's in a strange category (Electronic,
Ambient, Abstract) and I reached number 3 in the appropriate charts
yesterday!

Richard, very happy!

> something similar?

Well for those that are satisfied with performance in that range, an
accelerator should be enough to fill all their needs. But I do think
that filling the needs ppl had 10 years ago, is not a good way of
preparing for the future (if there is one). And I&#65533;d say you can almost
get an STe with a mono monitor for nothing these days.

```

You don&#65533;t know it will have no compatibility. I don&#65533;t know it will have
a great compatibility rate, but I will not say so either....

> I think that many talented programmers worked in the Atari MIDI field,

> software.

Yes, but I don't think that the simple solution should be hardware
running at speeds that even Ataris were up to several years ago, like a
68030 running in 32 Mhz. Even if I am a die-fan (and I am!), I would
simply not find it worth buying a machine like that.

And I think most programmers would not find it worth the effort to start
supporting a system that is not at all prepared for the future.

> I don't think something like a Coldfire based clone would. It doesn't
> attract consumers, it attracts enthusiasts.

Again, that should be heavily depending on how the machine will work. I
think that it is more likely that only enthusiasts would by a 100%
compatible clone running true 680x0 CPU in 32mhz these days. I would
rather advice them to buy a secondhand Falcon.

> I don't want to see it fail any more than I'd want to see a new games
> system, or a new car brand, or a new flavour of coffee fail. One, I

I didn't get down to the smoke thsi Xmas. Sorry.
It's still on my list - honest!

> Anyway, that software must be a right dog.
Well, it's the only thing I know of in existence that creates
resolutions and is part of the NVDI distribution. Yes, it does woof a
bit.

> I made sure very early on that I had Recovery options, so the
> minimum I get is 1024*768*256 via the VGA and under TOS. I've also
> recently completed a MAGIC/NVDI recovery disk so I can boot into
> MAGIC with NVDI from a floppy.
I haven't created a floppy backup, but I do have everything backed up
elsewhere on the HD. I've got an HDDriver backup to get into the HD
and I've always hoped that was enough.

The problem was that NVDI writes to the INF file on every boot, so
when something goes wrong it screws up on a permanent basis. Even
reinstalling the backup is no good.

Strangely as well, the dot clocks I detect from the hardware can be
different on each occasion I set up an INF file, so no one file is
compatible with another. The format also seems to be different between
VMG4000 versions. It's a miracle I got everything back, but I can't
find any way of recreating the higher resolutions I was happily using
at some time in the past...

> Don't you have a backup of your last working setup somewhere, won't
> the default installation give you something to work with?
As stated above, the backups refused to work at all.

> Once you get it working, reach for the floppies and make a boot disk.
I don't think that'll help in this wierd situation B^<

Once upon a time <94vtbkoqc1@nnrp1.deja.com>, Joakim Hï¿½gberg
<gokmase@my-deja.com> grabbed chalk and scrawled:

>Well for those that are satisfied with performance in that range, an
>accelerator should be enough to fill all their needs.

The people I'm thinking of are satisfied with the performance, but are
perhaps worried about the physical age of their machines, with plastic
cases, old circuits...

>But I do think
>that filling the needs ppl had 10 years ago, is not a good way of
>preparing for the future (if there is one).

The future of computing is media. The future of media is accessibility.
The media is governed by standards.

Try launching a new TV standard. See how far you get.

>And Iï¿½d say you can almost
>get an STe with a mono monitor for nothing these days.

In some markets. The people I'm thinking of have the money, but aren't
interested in looking for a cheap STE. They go to, say, Atari workshop
because their studio Atari has just gone boom and they have to have
another working one /now/.

>Because one would want the niche to stay alive, and not die due to
>outdated hardware?

But it's a niche. And the new hardware IMO doesn't make it any less of a
niche, it makes it a different niche, one which again, IMO, has no past.
It's just another weird computer.

>You donï¿½t know it will have no compatibility.

I've got a better chance of being right than people who say it will be
compatible.

>Yes, but I donï¿½t think that the simple solution should be hardware
>running at speeds that even Ataris were up to several years ago, like a
>68030 running in 32 Mhz. Even if I am a die-fan (and I am!), I would
>simply not find it worth buying a machine like that.

I'm thinking of particular applications. The speed of the application is
less critical than the fundamental design of the system, specifically
MIDI timings, and the ability to run older software to allow back-
catalogues of data to be re-used.

>And I think most programmers would not find it worth the effort to start
>supporting a system that is not at all prepared for the future.

Prepared for who's future?

Just because a computer can't do Java, or play MP3s well, or have
superfast 3d graphics, doesn't mean it isn't prepared for the future.
And I feel that a machine which has a fairly specific purpose has a
better chance than a machine which tries to do those things, but will
inevitably be inferior /to the end user/ to existing, readily available,
widely supported hardware.

>Again, that should be heavily depending on how the machine will work. I
>think that it is more likely that only enthusiasts would by a 100%
>compatible clone running true 680x0 CPU in 32mhz these days. I would
>rather advice them to buy a secondhand Falcon.

Again, secondhand brings with it no warranty, doubts about reliability,
plus the Falcon has issues Atari never ironed out.

I would rather buy a machine that had a slower processor and
architecture, but that I knew would do exactly what I wanted and wasn't
messing around trying to integrate multimedia and stuff, then something
which is theoretically powerful enough to do anything, but ends up doing
nothing well.

Hi Hallvard

Before you click on 'Edit', there is a menubar that let's one make a
colour or bw icon, it's in the middle top part of the window, IIRC.
Is this of any help?

Hi Bob

I bought a (whisper mode on) Microsoft Natural Pro (whisper mode off)
, and for me the Caps Lock led works. The Num Lock doesn't, but I
think that's just as good. I use those keys for numbers only.

Ralph,

The early versions of the Supra host adaptor didnt like bigger drives.
I remember trying to install a Quantum 105s in a Supra but, it wouldnt
work. Then I was told I had a older revision of the adaptor and that
was the problem. It had the same miniscribe in it. Everyonce in awhile
it wouldnt spin up so I kept the screws of the cover so I could give the
magneto on the side of the drive a spin. It worked for years and after
awhile I didnt have to spin it up.
\
Good luck,

Don

> cases, old circuits...

I find it very hard to imagine that there are enough of those people, to
make a clone-project like that work. I know of all too many Atari users
that moved on to PCs some years ago, because their atari could not do
what they wanted to, and they were using it for midi and audio.

> I would rather buy a machine that had a slower processor and
> architecture, but that I knew would do exactly what I wanted and
wasn't

something
> which is theoretically powerful enough to do anything, but ends up
doing
> nothing well.

I guess it all comes down to what you want the thing to be able to do.
An Atari with those specs would not be able to do what I want it to do,
that is why I would not consider souch a machine.

Enough said, opinions seems to differ.. ;)

1424. Papyrus and GEM metafiles

Newsgroup: comp.sys.atari.st
Date: 2001-01-28 12:02:23 UTC
From: jtmartin@gofree.indigo.ie
Message-ID: <jTTc6.12675$s4.6747@news.indigo.ie>
Source record: 51061

Hello all,

I've been wondering if it's possible to get Papyrus to import ArtWorx/Kandinsky GEM metafiles in colour?

I used to think this was a papyrus problem until GemGraph colour graphs imported correctly with all colours intact. When I import a GEM metafile from either Kandinsky or Artworx all the colours are changed to blacK! Hardly ideal.

I've just received my copy of ArtWorx and was hoping that this problem would go away... alas it didn't. (Seething about this as ArtWorx is capable of some great effects...)

Does anyone have any ideas/suggestions on ways to get round this?

Ulli Ramps from Rom-Logicware told me this is a problem with ArtWorx/Kandinsky not obeying the GEM standards. =(*sigh*

I'm using Papyrus 8.23A, ArtWorx 2.09, Kandinsky 2.51, NVDI 5.03, Magic 6.01

Any help/advice appreciated!

Regards,

Jerry

1425. WTD: Reset-proof ramdisc for TT

Newsgroup: comp.sys.atari.st
Date: 2001-01-28 12:06:17 UTC
From: G Swaine <g.swaine@the.gluepot.com>
Message-ID: <95127a$3ko$1@news.comnet.co.nz>
Source record: 51063

Can anyone suggest a good resetproof ramdisc that uses TT RAM ?

At present, I use the Hisoft HRAMDISC that came with Devpac/Lattice, but this gobbles ST RAM, which causes a bit of a problem for me.

After setting HRAMDISC to a decent size (1.5 megs - I have around half a meg of files that get loaded when the ramdisc first starts, and I need about 800k of free space on it while working), there's precious little ST RAM left (800-900k is typical, and not enough if I want to use the SLM printer under GDOS).

Is there a resetproof ramdisc that actually works, and uses TT RAM?

What browser are you using? MP3.com relies on cookies to track listens
and stuff (if you do well, you get paid for listens, though I'm not even
close to getting the sort of traffic that makes it happen), to prevent
cheating of the system etc.

OVL?

If you want to hear the music, much as I'd like to get the traffic to my
site, I'm happy to email you the MP3 file - it's about 2.6Mb though.

Hi,
It depends on which country you're in... ;)
Here in Sweden, SAK ("Svenska Atari Klubben") arranges NAS (Nordic Atari Show) every year, with enthusiasts and dealers attending and there are always a couple of very interesting seminars held. NAS is located in Malmo in southern Sweden this year and you can find more info at: www.sak.nu .

no need to whisper, the product you're speaking of comes from the
GOOD Micro$oft.

there's actually two Micro$ofts - there's the good one, which
actually comes up with great innovations (the optical mouse, the
ergonomic keyboard, IE5 for Mac), and then its evil twin, which makes
Windows :)

but of course some good comes out of the evil Micro$oft, a chance to
laugh - like what happened at Comdex Canada last July at a keynote
speech. E-mail me and I'll supply the gory details :)

Hi,
You can probably find schematics for the computer here:
http://www.fortunecity.com/skyscraper/quadra/455/
I don't know if there's any schematics available for the cartridge itself,
but it should be possible to sort out how to connect it if you check out the
ST's schematics if you have enough knowledge about computer hardware...

I agree up to a point, but having had 24-bit video on my
TT for years, and some people do need it for preofessional
uses, it simply comes down to you cannot please everyone.
If I use my raytracer, I can tell 65k output from 24-bit output
fairly easily for example. Sure it may depend on the image
in some cases. ;-)

> makes it worse than the original sample.

I don't use DeNoiser now myself, but I tried it for a while before I
switched to PC - and I didn't notice any such problems.
The only time there should be problems is if you run at 48kHz and move the
fader. Then there is some noise because the DSP can't handle the load - but
if you don't mive the fader, the result should be ok. If running at 44.1kHz
instead, this problem shouldn't appear (according to both SoundPool's
replies to me and my own experience).

> Maybe this is because one has to mark some quiet passages (containing
> only the noise to be subtracted) and I found no way to be sure I

> easy as at audiomaster). But as it is I'm not sure whether the bad
> results are my fault or denoisers fault or somehow my hardware causes
> the problems (which is the least probable reason I think).

I could imagine there may be problems either if you have an accellerator
which isn't completely stable installed - or if the CPU-clock modification
hasn't been made.
Otherwise, it could be as you say, that you haven't found a "quiet" passage.
The best place to find the right spot is just before the music starts - and
you don't need a long passage. Just a second or even less should be enough
for the program to be able to sort out the tape noise and hum. Don't apply
too much of the DeNoiser effect either - then there's risk to start to
destroy the original music too...
When I tried the program, I also had the first model of Behringer's DeNoiser
(rack unit for studio use) and the DeNoiser program for Falcon actually
sounded better and didn't remove as much treble as the rack unit when both
reduced about the same amount of noise...

> anything.

Have you checked if there's a driver for it in the MROS-folder? To activate the driver, you must rename it to .DRV in the extension. When inactive, the extension is probably .DR - so you have to add a V ...

> Does this only work with Pro 24? I believe Pro is free now, where can I get it?

Pro24 is still under copyright by Steinberg, even if it's not being sold anymore - but I'm sure someone has put it on the web somewhere, even though I have no idea where.
I'm pretty certain that you should be able to use the SMP24 with Cubase - just try to find the MROS driver. BTW - do you use an original of Cubase? When I used my ST's, I tried the Midex+ with a couple of cracked versions and it was impossible to make it work correctly - while it worked perfectly with my original. Maybe the same problem could apply to the SMP24 - I don't know, but there may be a risk for it...

>sufficient IIRC.
>
>Does that help?

Hi Harry!

Fraid not! All of the ICD programs I had had AHDI compatibility options
and my disks were formatted that way, I believe. But on the Falcon,
running any of the versions of HDUTILS.PRG brings up an 'ICD Host
Adapter or ICDBOOT required!' alert, and attempting to run ICDBOOT.PRG
shows its loading screen but then freezes with only device 15 showing.
Maybe it doesn't recognise the internal IDE? Even with an external SCSI
connected as well, it still freezes the computer and I have to reboot.

Doesn't matter too mucg as I have HDDRIVER now, but I wanteds to use
some of the auxilliaary programs from ICD but couldn't.

From: computerclassics@my-deja.com
Message-ID: <9523ea$c7f$1@nnrp1.deja.com>
Source record: 51078

Hi All,

I posted this message back on Jan 13th but received only 1 reply, which did not contain the information I was hoping to find. So...one more try before I give up.

Does anyone know what the last four 'commandments' were that Jack Tramiel issued regarding the marketing of the Atari ST? I've only been able to uncover the first 6 from the magazines that I have in my collection. I've included the ones that I do have below. Thanks!

Bill Gaskill
www.timeline.99er.net

During Tramiel's early days at Atari he brought out the ST line and surrounded it with a lot of fanfare and marketing hype. Among the most remembered hype was "The Atari Ten Commandments":
1. We shall create a computer that will be a landmark in the history of computers.
2. We shall create a computer that is as smart as the buy who buy it.
3. We shall create a computer that sets a new standard for speed and performance.
4. We shall create a computer that lets consumers choose what is right for them.
5. We shall create a computer that gives consumers power without the price.
6. We shall create a computer that is as powerful in the music studio as it is in the office.
7.

It's a 9 pin socket, same as the MegaSTe. All atari 16/32 machines have the
MFP, except the Falcon, which only has the SCC and uses an emulation mode,
and that is a bit troublesome too.

Sorry to tell you but I missed this particular campaign, if it was
standard atari it probably only ran in southern california, with a couple
of brief fly bys in New York City and Chicago. I've seen some of the
lines you have collected, but never under some grand Atari's 10
commandments.

However in the flavour of the previous respondant, I think this
was in there somewhere ... We will provide a computer that will be
available RSN...

I witnessed that one quite a bit ;)

I know of many people who run magicmac on G4's; just make sure you don't use the recently released Macos 9.1, as no current MM version runs on it.

Well I've got it running sort of but it's only syncing via midiclock.
Anyone got an original going cheap?

Chris

Caps Lock should work (check under TOS, but I remember fixing it for Magic
quite some time ago). Num Lock is never lit since TOS does not have a num
lock function.

>using unimplemented integer/fpu instructions handler...

Well? TOS *does* RUN on a 040/060. And for the Milan, TOS was not rewritten
- part of the (X)Bios was, as far as new hardware was concerned (but the
same happened for the TT or Falcon). Gemdos, VDI (at least in monochrome
mode) and AES are modified but not rewritten.
The Milan TOS is not a patched 4.04 but a clean re-compile with the changes
applied where necessary.

I was trying to point out that originally TOS did not run on 040/060.
So, the patches to TOS to make it run on 040/060 was not only to make
it work with PCI, new hardware, etc. Kinda tried to say that it would not
be hard to make TOS work on a CF 4e CPU and that emulation would not be
necessary if you, for example, recompiled TOS for it. Ofcourse, necessary
changes would have to be made to (x)bios.. but that is indipendant of CPU,
only dependant on the surrounding hardware.

Hi

I would like to apologise to anyone who has been waiting for replies to emails or enquires etc.. over the past few months, this was due to ill health.

But during an upgrade I blew the motherboard, hoping it's just motherboard, on my main machine:(this means I don't have access to any email or addresses sent to me BEFORE or ON Sunday 28th January.

Talk about bad luck, I reinstalled an operating system on the laptop and it wiped out my entire hard drive partitions including the updates to my web sites and my entire inventory of Atari gear:((and the web sites were nearly ready for uploading...

Anyway, if you have written to me on an urgent matter, please rewrite and I'll do what I can.

I have a very early version of Magic Mac (1.04 I think...) that won't run on my PowerPC. Says I must have a 68030 / 68040 with a PMMU.

Any suggestions around this problem?

I tried using the upgrade files from ASH web site, but they don't support the version I have.

Bill - sorry, I was hoping someone else here might know more about these "Commandments" and fill in when I posted the "13th Commandment". (although I really did like the "RSN" one...)

While I don't recall ever hearing anything about these particular statements from Jack (and I was pretty heavily involved through most of the Tramiel years), I'll be the first to admit I might have missed the "slogan of the week" for that week.

(Atari changed slogans about as often as the Tramiels changed their underwear - witness how soon these "Commandments" were forgotten).

A suggestion though - try contacting Don Thomas at http://www.cheek.org/atari/

He worked at Atari, although somewhat later than the timeframe you appear to be indicating for these slogans, but he's something of a historian and might recall having seen something about them.

In a world populated with Tramiels, Don was always one of the "good guys".

The one from CodeHead uses STram or TTram, you decide and
is RESET proof. What mystical basis determines that TTram
looses it's contents apon reset? Might be the case with
a card needing a driver, but it's not he case with a TT.
I used the CodeHead ramdisk for ages with TTram, it works
and can even preload an entire disk image at boot up.

Hi,

>Is there a resetproof ramdisc that actually works, and uses TT RAM?
I thought there were plenty, but after wading through a lot of them I've come
to the conclusion that this is an utility which is missing (?)
The best I can come up with is MDISK 6.94, this will use TT RAM but then it
will not be resetproof....

If you use MagiC or MINT then there's no problem, plenty of dynamic ramdisks
around for these OS's.

<SNIP>

There are two kinds of RAM in the Atari TT: The normal ST RAM (slow RAM) and
the additional TT RAM (fast RAM). M-Disk 6.3 and later uses the TT RAM
whenever this is possible. In cases when there is not enough TT RAM
the ST RAM is used.
You should know the behavior with reset resident disks. Currently reset
resident disks can only be installed in ST RAM. So whenever a disk has been
installed in TT RAM it is impossible to make it reset resident without
removing it and installing it again (thus loosing the contents).

If you have TT RAM in your computer and want a reset resident RAM-Disk
you have to turn on the `reset resident' button inside the setup dialog
before installing the RAM disk.
On the other hand if you select the `reset resident' button you will force
installation in ST RAM. But if you deselect the `reset resident' button
M-Disk will do installation in TT RAM only if there is enough TT RAM space.
<SNAP>

A copy of MDESK 6.94 is now in your mailbox :-)

Cheers from Belgium
Dennis

1465. Re: Problems With STinG

Newsgroup: comp.sys.atari.st
Date: 2001-01-29 16:32:40 UTC
From: Dennis Vermeire <dennis.vermeire@gmx.net>
Message-ID: <980795272-49156AEicMi@gmx.net>
Source record: 51015

From: "Martin \"Nightowl\" Byttebier" <tos4ever@online.be>
Date: Sat, 27 Jan 2001 21:20:46 +0100 (MET)

Hi Martin,

>>IConnect 1.7 works with MiNT
>
>But works Iconnect 1.8 with MiNT? AFAIK, no.
No it doesn't, simply because it uses some features of MagiC which aren't implemented in MiNT, one of these features are threads....
BTW: a multitasking OS that doesn't know threading? but that's off topic of course :-)

>>Emailer 2.3f works with MiNT as well...
>
>Wow that's what I call world breaking news. One Iconnect client that
>works under MiNT. I'm impressed.
Well, considering that you've claimed here that nothing works...
CAB is also a client, so that makes two.

>Tell me how performs the rest, Chatter, Teli, Fiffi under MiNT?
They don't... and simply put, they shouldn't. If and when someone opts to use IConnect as stack, he also opts for MagiC. You may find this unlogical but I can reverse the question.. MiNTNet clients need their appropriate OS also in order to run, don't they?

>>With IConnect it takes exactly 23 seconds to dial and login to my ISP...
>>Checking and retrieving 23 mails from the POP server and 87 postings from
>>5 different newsgroups took exactly 1min 37 secs... on average download
>>speed from the chapelie ftp is 5200cps. If this is "damned slow" then I
>>must have hit the slow motion button somewhere along the line...
>
>As on my machine I only can make Cab working with Iconnect and MiNT I
>can only share you my experience with Cab and Iconnect. If I've the luck
>Cab will go up to 2.500 cps when I use IConnect.
You've stated here that IConnect is "damned slow", I've given you some of the figures I get on average...
Whatever you get with IConnect under MiNT is beside the point, give us the average figures you get using your favourite stack and clients. How long does it take to get a connection to your ISP, how many postings and mails can you retrieve in a minute, what's the average download speed from the chapelie ftp server? I'm bracing myself here for some amazingly fast numbers... "damned slow" must mean at least 25-30% lower then yours.

> With MiNT-net Cab usualy doesn't go under the 4.000 cps.
4000 ? that's pathetic....

>My phone line isn't good. In order to get a stable connection I must
>tune down the modem speed to 42.000 bps. Even then downloading stuff
>from the ftp-servers using wget for instance happens usualy with 4200
>bps.
Which still isn't good enough...

Cheers from Belgium

1466. Re: Good news about Coldfire clone

Newsgroup: comp.sys.atari.st
Date: 2001-01-29 16:32:46 UTC
From: Dennis Vermeire <dennis.vermeire@gmx.net>
Message-ID: <980795264-47383AEicMi@gmx.net>
Source record: 51010

From: Odd Skancke <oskancke@online.no>
Date: Sat, 27 Jan 2001 00:17:59 +0100

Hi Odd,

>The 8 months to me is great new, as that means they will wait for 4e to
>become available. I agree with it being a hopeless project using
>non-pmmu/fpu version of the ColdFire.
Yes, that's exactly what they are claiming, but just like with the previous processor they intended to use, they haven't got a clue what the Coldfire 4e is capable of. It's like someone whispered in their ears " wait for the 4e, it looks better on paper"... it seems to me that the big argument to wait for the 4e is the mere fact that it is faster, Ulrich Goessel simply hasn't got a clue of the mmu/fpu problem, which IMO tells us a lot about this project.

>CAB is a dead-end, I agree, but then again, we've got XGEM so we can soon
>run netscape on Atari.. under MiNT ofcourse.
Oh boy...not again. Instead of claiming things like this why for a change not actually do it? time and time again I've been reading stuff like this here... in fact it's the *big* MiNT argument, one can port all these nice apps to it... well, where are they?

>I think your attitude is bullshit! Afraid MagiC wont run on it?
What on earth is MagiC doing in this discussion? have I mentioned it once? but since you throw it up in here...
I've written this hundred times before: the day that there are some real MiNT applications available (like that Netscape port) I'll switch. I'm not married with ASH and I haven't got money invested in them either. But at the moment there's not *one* application out there that can even persuade me to switch. I would say the opposite is true...
As for the Pegasus: a TOS compatible clone should be able to run MiNT *and* MagiC, if none or just only one of them would run on it, I certainly wouldn't buy it.

>I will personally make sure MiNT runs on this machine, if it becomes
>available. Thats why I'm so concerned it MUST have a pmmu. Ofcourse
>recompiling isn't enuff, but one have the full source, so making it work
>is not hard.
Nicely spoken, better get to work... only 7 months and 28 days left, if it wasn't for the Coldfire 4e CPU, the Pegasus would have been for sale in 8 weeks from now :-)
You still don't think that's bullshit?

Cheers from Belgium

>As to your question on a site that works or don't work. Here are
>a couple for you to try with the Iconnect OVL.
>
> http://www.forbes.com/
>
> http://www.planetarion.com/

Both sites can be accessed and seem to work with no problems what so ever. Is there a section on the forbes site that needs to be accessed? It seems to be a portal to news snippets...

Planetarion is just great! thanks for the tip :-)

This of course means that the question still stands... what can the two alternative STiNG/STIK OVL's do or access, that the IConnect OVL can't ?

Cheers from Belgium

>Well, I can't tell you if there are any Milan-specific applications, but
>there are Milan-specific drivers, which drive sound/scsii/etc.
Nice try... but you know very well that I ment applications in a real sense
of the word. Of course there are specific drivers written for the Milan,
without these one couldn't even get a display (S3 driver).

>Ever used Papyrus on a bog-standard Falcon editing real heavy documents?
One could argue that you need the right tools for the right job..
Papyrus isn't suited for this, try out the demo of Tempus Word Pro and be
pleasantly surprised.

> I think the speed of the Hades/Milan is enuff to call Papyrus a "clones
>application" ;-)
I would rather call it a "shitty application" then a "clones application",
it's not because it's the only English wordprocessor around these days that
one has to drool over it...

>Then you don't know that the main MiNT maintainer is actually maintaining
>using a Milan 060?
No... and what on earth has this got to do with it?

>>Three years on... with an ever shrinking number of authors some German
>>clowns hope to attract a *lot* of talented programmers to get their crazy
>>design working, that's pure nonsense or to put it bluntly: bullshit :-)

From: Michael and Nicole Freeman <nameerf@flash.net>
Date: Sat, 27 Jan 2001 19:52:14 GMT

Hi Michael

>>It doesn't really matter that the 680x0 isn't produced anymore, it's not
>>like there's a need for 100.000 of them. If a new clone would be produced
>>and 2.000 units of these would be build and sold, it would be an
>>*enormous* success.
>
>Yes. However, if there is to be any kind of future for Atari clones, what
>will happen when there are no more 680x0's left, even if that is far in the
>future? We will be forced to either switch to a different CPU anyway, or
>just give up. Wouldn't it be easier to start the transition now, while we
>still have options?
I don't think so, I realise that there will come a day that there are no
more 680x0's available, but by that time Motorola could have possibly
designed a Coldfire 5e, which would be 100% compatible with the 680x0.
That's the problem when one has to predict the future, if I could..., then I
would be a millionaire and produce Atari clones simply for a hobby , giving
them away with a box of corn flakes :-)
Seriously... IMO the Coldfire 4e simply is much to limited to be used as a
proper replacement, if one would be forced to switch to a different CPU
today, I would say that the PPC is a better alternative. Which doesn't mean
that I changed my mind about the Tempest card :-)

>An example of software that we can't use because of lack of CPU speed is
>Java applications. More and more web sites are using them, and if we are
>going to stay online with our machines, we will have to be able to use Java
>at some point. 68060's are way too slow to make this really usable. My G3
>Mac even slows down quite a bit to run Java apps.
I don't really think so... the way things are going, the web will be accessed
in the near future with cellular telephones (WAP), TV top boxes, handheld
organisers... etc. Websites using Java apps, flash modules, enormous JPEG's
or anything similar will fall out, most of the websites these days are pretty
looking, but not functional... I think this will change a lot in the future.

>Basically, my point is that we do too much settling for 2nd best. Over the
>years, I've always heard in this group, "we'll never need X, we can do just
>fine with Y because it suites our current need just fine", and then a year
>or two later, everyone is complaining because Y won't do what they need done
>and we have to struggle along with Y while the developers try to implement
>X. Meanwhile Z comes out, and we say, "we'll never need Z, we can do just
>fine with X..." etc.
I understand your point, but it's a universal problem, not an Atari related

issue... PC or Mac users face the same dilemma.

IMO the big problem here is money... in general Atari users don't like to spend money on upgrades, this has been proven time and time again. Why are they developing the Tempest card? Simply because it's cheaper then a PPC clone. The fact that this card needs to be fitted in an "outdated" computer doesn't seem to bother most of the people here, it's cheap... and that's all what seems to matter.
Suppose they would design a full blown TOS compatible PPC clone motherboard based on the Tempest engine, would it really cost that much more? add the cost of the Eclipse and the Tempest together... non Falcon users have to fork out money for the DesTTiny card as well, the proposed price tag will probably be higher... one thing is certain, it would blow the Pegasus away...

Cheers from Belgium

Hi Jo Even,

>> average Atari user could possibly want. But the authors didn't share that
>> enthousiasm, I've still got to see the first Milan application appear...
>
>I don't understand what you're trying to say here...
I'll try to explain it.... read on :-)

>Is Milan-only applications what you want? Why? Modern applications and games
>use the OS and not the hardware.
No, what I would like to see are applications that are written exclusively
with the 68040/68060 in mind.

>Graphics editors will benefit from accelerated graphics cards (and not only
>on the Milan, and not only one specific brand and model), but won't *need*
>them, only run a lot slower on old hardware.
Yep, I know this but the bottomline is that most of these apps are written to
run on a ST/68000. While there's nothing wrong itself with these apps, they
lack features which aren't implemented by the programmers simply because
there's no point... (too slow).

>Sound applications will perform better with a modern sound card on a Milan
>or Hades than on a plain Falcon, but it will work on both. Word processors
>will run faster, thus utilizing the faster CPU. Games like Doom or Quake
>will benefit from faster graphics and a faster CPU, but will still work on
>a Falcon.
That's logical... I'm not saying that development for the ST/TT/Falcon should
stop, but merely that applications for the Milan and Hades should appear...

Why does a PC or Mac user upgrade his machine frequently? it *could* be to
run some of his apps faster, but more likely it's because he wants to use the
newest apps which require a faster processor to run. A Pentium 200 may be
fine for M$ Office, but it's not good enough for editing Video or play DVD's.
The above situation is something which we as Atari users have hardly ever
known. Except for some specific Falcon software, when we upgrade to a faster
machine it's simply to run the apps faster. For some of us this extra speed
is essential, but the general mood here is usally that it's not such a big
issue. Someone who uses a CT-2 Falcon or expanded TT has no real incentive
to buy a Atari clone, except for the fact that it will be faster, everything
remains the same.

If however there would be apps around that simply need to be run on at least
a 68040 and preferably higher, there might just be an incentive to upgrade.

In another thread someone is playing with the idea of porting the Netscape browser... it doesn't take a genius to realise that one simply needs a more powerfull processor than the 68030 to run such an application. The simple fact that it's possible to run such a program only on a clone could well be the incentive for people to finally upgrade.
Why have so many people bought a Falcon when on paper the TT is much better, IMO they bought it because of the dedicated Falcon apps...
What I'm trying to say here is that there should be apps developed that offer possibilities which simply aren't possible on the older machines. With apps I don't mean drivers, but real applications. Before you ask me what apps I've got

in mind.. well, I've got a wishlist that's at least a mile long, from a simple game all the way up to live video editing, you name it and it's there...
And no... I don't really mind if some of these would be ported MiNT apps, we can't afford to be choosy anymore, the handfull of commercial developers that remain can't turn around the mess we're in either.

A while ago Dan and Lonny talked here about the catch 22 situation, it's quite obvious to me that to break it, it will need to come from the developers side. Atari users don't upgrade their computers to run existing apps faster. The Hades and Milan have proven this... less than 1500 computers sold in a period stretching well over five years!!

Cheers from Belgium
Dennis

PS: I've known people that bought an ST simply because there was something like

1st Word around in 1985, the TT was bought in 1990 because it made DTP possible

for an affordable price, the Falcon sold in numbers because of some dedicated packages like Cubase Audio (a miracle in 1993) etc...
What's the incentive software-wise of bying a clone?

Hi folks,

I'm having a bit of a problem with one of my Flacons...it is recased with a desktopper and as I use Panasonic PD-650 drives (joint MO and CDROM) for back-up storage I wanted to put one in there...unfortunately what I was sold as a SCSI device turned out to be an IDE one (I didn't know they made an IDE one)....the drive powers up OK, and I have it installed as a slave to the Falcons IDE boot-drive (a 3.5" 120Mb Samsung) however it isn't being picked up by HD-Driver 7.71....Is there a general problem with this type of drive when it is IDE, I have a SCSI external; one that works fine...alternatively I'd be interested in getting an internal SCSI one in exchange if any of you have them on PC's.....

It is tricky installing big drivers, I found that the drivers parameters needed to be added manually plus getting it to Autoboot was also a bit tricky.

Find out the exact details in of the bigger drive (the one in my brothers is a Maxtor), you should be able to locate all of the info and enter it, what version of the Supra drivers do you have (IIRC I have version 3.01 or something but different programs came up with different versions).

Mark.

Hi guyz

Guess who's on the "Extreme Risk" redundancy list for this round!.

How does "Unemplyed work" in Britain?.

STEve.

Define 'clone' ..... (moreover what is an 'Atari Clone' I can't
run XE stuff)

In my books, I would say it is a computer that will run the applications
originally made for the original computer BUT it should have an OS to do
this i.e. you can't say a PC running DOS but booting directly into Pacifist
is a clone, if Pacifist was able to boot directly from the Harddisk boot
strap then I would probably call this a clone so by this rational if
MagicMac did not need MAC OS then I would call it a clone.

A Falcon is not far off what you describe, it has different harddisk
controller, different CPU, different graphics chip, different bus, different
serial ports, different parallel ports, different floppy drive, different,
different, different and the TOS was massively changed to make these items
available, you then start to run SOFTWARE such as backwards to make ST
Emulation more compatible, your Hades was not even made by Atari. Any of
your machines running Linux? are they not a Linux clone?

And in my opinion this is all academic "beggars can't be choosers", what
good is an OS with a 10 year old platform in this day and age?

Mark.

Give an example application for a clone that has its own software beyond
drivers and the supporting software and will ONLY run on that clone?

I don't care either, its Microsoft I hate and basically the 680x0 is a sinking ship however I would use Via/AMD arrangement rather than Intel.

I do understand how this depresses people but direction needs to be found and soon we are not going to have anyone building hardware for us if we have attitudes like the above threads suggest. I would prefer us to go down the PPC path to at least keep the Motorola feel but as mentioned we may have no choice and soon the remain software developers to rebuild there drivers, OSs, etc to boot on a 'Intel' MoBo and that will last about 4 days until the Atari community start to fire bomb them.

That's it, no one will help me sort out my Crazy Dots card and Sting problems after these comments.

Mark.

> I find it hard to grasp that people who never seen a 68060 in action
dismiss
> it purely on the basis that a PPC or Coldfire *could* be faster.

The 68060 is one of the reason why the clones are so expensive, these things really are not cost effective. The PPC and coldfire are *faster*, they just are, OK maybe not as much faster when emulating but then that is why people use C and not Assembly these days so things can be re-worked easily (many bits of software have 030 versions as well as standard 68K).

> What software do you use that needs to run at "three times" the speed of a
> Hades 060? except for some raytracing stuff I can't really think of
anything
> that would benefit...

Doom, Quake, High speed Multitasking, Papyrus, RayTrace (as mentioned), DTP (I imagine)compression could be faster, copying, and I think generaly my TT is running a bit slow for most of the things I do on it.

What software would you like to see runing in TOS but has never been developed because the platform is to slow?

I would like to see Java, OpenGL (think how much easier it would be to port games, OK just an idea but its fesable), usable Emulation (Win 95A would be cool), etc, etc, etc. Lets not be narrow minded and limit ourselves to the software that was made 10 years ago, many of us still use TOS machines for more than music (I don't even have a midi keyboard).

When your bought your Hades what was it you needed to run faster?

> This is a joke right? the Coldfire isn't exactly a processor of which I
> would say it's "in the general market".

The 68060 only ever made it into Hades and a few Amigas, the 68060 went into thousands of embedded applications such as routers, etc. This is why the Coldfire is used in embedded stuff because it was the intended replacement for the 68060.

But OK I concur it is not really a desktop CPU but I believe it is more adapt than the 68060 especial seeing as Motorola realise that they need to introduce more compatibility and bring back the PMMU and FPU (which by the way was also cut from the later 68060s as they were not being used I imagine). Note that last bit is only based on what I have read here.

Mark.

In fact, NVDI5 does finally support Matrix cards at last! At one time
I had v2.51, v4 Matgraph and v4 ET4k and there was no cross-grade
allowed in a similar way that there was no cross-grade between Atari
and PC/Mac versions. Now, at last, all are on the same disks.

The most frequent benefit of running faster than a TT would be the
speed of unpacking JPGs in CAB!

While I'm on the subject, how come there isn't a JPEG_OVL that takes
advantage of an FPU copro and not just the Falcon's DSP in the
Brainstorm/Fieblkorn version? That's what I'd really like to see.

Dan?

It's for the use of the Serial 1 port on the VME backplate of the TT -
not to be confused with the Modem 1 port which is for backward
compatibility with software that only recognises the ST modem port,
which still uses MFP.PRG.

> SCC is for the two ports driven by the SCC, the LAN and
> Serial/Modem 2. I have no Idea how this are presented socket wise
> on the back of a TT. Put both in after drvin.prg and you'll be safe.

Modem 2 is next to Modem 1 and <ahem> Serial 2 is next to Serial 1 on
the VME backplate. If you set the SCC to LAN rather than serial 2,
that's obviously by the MIDI ports...

Except of course if you have a VME card, in which case you have a
right arse of a game to file the case down under the backplate where
the cables would have been, plug the backplate cables back into the
MB, slide the graphics card back in and try to get the modem plug into
it without fouling against the monitor, printer and DMA cables...

My opinions on Falcon build quality are already on record (ie little
or none). In terms of software compatibility it should be remembered
that the TT was out there for far longer and older software was much
more likely to be made compatible with it.

> Define "business" ;-) The Falcon is much better suited for games,
> demos, graphics and sound in general. But the TT can have upto
> 256Mb RAM, and with a graphics card (Mario Becroft is selling his
> Galaxy card now I believe) it beats the Falcon easily when it comes
> to "serious" graphics.

Graphics capability out of the box is little better on a TT than the
ST. 320*240*256 is pointless and 1280*960*2 is unavailable unless you
have the a monitor that drives this resolution (in whichcase it allows
no other). That just leaves a respectable 640*480*16. A stock Falcon
(while treacly) beats that pretty comprehensively.

Mario's card is not supported by graphics card versions of NVDI AIUI
(is that right?). That may well give people concerns. Which means a
second-user graphics card needs to be sourced, which is often a
problem...

>>> What are the fundamental differences in operation between them,
>>> and is the TT any more reliable with software written for the ST
>>> such as Explorer32?
> I don't know Explorer32, but the Falcon is generally more

I have run Netscape under MiNT on my Falcon using XGEM. XGEM is still
alpha though, so it wasn't very stable. It wasn't very fast either, but
that was probably caused by me running it remotely over a modem connection
;-)

I don't know if anyone has attempted to actually compile and run Netscape
under MiNT. Personally I wouldn't bother, it's just too big and bloated
(and pretty crap anyway).

Well, I don't know much about the project at all, all I know is that if a
ColdFire 4e machine really makes it, I'll get one. If a machine wihtout
pmmu appeared it would NOT get one. Mind you, pmmu is not important to
anything but MiNT, as no other OS's use it.

In fact, we can already now use Netscape (along with other x-apps)
remotely on MiNT becaues of xgem.

For nice mint apps, try sparemint.atari.org

Well, some Falcons can't even run MagiC right. And Falcon's are not
considered a clone, now is it?

Ok, in that case there are no Milan or Hades specific apps, only
Falcon-specific apps. The rest works on all other Atari/TOS-clones as
well...

I think Papyrus is a great application. What makes you think Tempus Word
is better? (I've not tested Tempus Word, mind you). Papyrus on Hades is
very nice. Papyrus on Falcon or TT is a nightmare

>I've tried to copy the icon, move to the black/white part then "paste",
>but no go.
>How do I do this without manually having to re-draw the icon?

Don't you have the manual? The procedure is described there (p.57-8 in
my original Compo translation - 'The clipboard'):

Load the colour icon into the editor and use Control-C to copy it to the
clipboard. It will be saved both as a colour XIMG (*.ICO) and a mono
IMG. Open the clipboard and delete SCRAP.ICO but leave SCRAP.IMG. Now
switch to mono resolution, go back to the icon editor and use Control-V
which will copy the first plane of the image file to the editor's
drawing area. The outlines of the colour icon should now be visible and
can be used as a template for the correspopnding mono resolution
version.

This procedure works because Interface will only insert an IMG file in
the icon editor when there is no ICO file in the clipboard. This is
because the ICO file also contains the monochrome resolution of the
icon, which however will be empty for Windows and OS/2 icons. By
deleting the ICO file one forces Interface to insert the IMG file
instead.

I have just checked and this portion seems to be missing in the Tom
Thomason version of the manual :-(

Mine doesn't! In any case, all that's in it is the cache sizes and the paths to the fonts and printer etc. What it does/can write each boot is the LOG file, though you can prevent this by putting LOGFILE = U:\NUL under MagiC. I believe you must be thinking of another INF file, which is why reinstalling NVDI.INF won't help your problem.

1503. An idea of value for a system.... (In UK)

Newsgroup: comp.sys.atari.st
Date: 2001-01-30 00:07:49 UTC
From: hairy.biker@ntlworld.com
Message-ID: <1eo0syh.1e9j8e6zlx68lN%hairy.biker@ntlworld.com>
Source record: 51038

Hi, I have had my ST for about 10 years, and now I have a new iMac (my second Mac actually), I am near the end of my need for the ST.

All I use it for is to edit VHS videos from the home camcorder tapes. I plan to by a box for the iMac so I can connect that to the VHS recorder instead.

I'm looking at possibly selling the ST setup - complete if possible - in order to raise a bit of the cost of a USB-TV out adapter.

Anyway, I have no idea of what the kit would be worth nowadays, and I'd appreciate a bit of advice there.

The systems consists of....

Atari STFM 512k - TOS 1.4 (aka Rainbow TOS) - with;
2mb upgrade from Power Computing - a total of 2.5mb of Ram.
a High Density internal floppy upgrade.
a Power Computing DS external floppy, with blitter.
a Star LC 24/200 mono printer.
cables and power supplies.
Trackball
Hi-res mouse.

Software includes,

A massive box of cover disks from 1990 to 1995 - many full applications included - such as Harlekin, EasyText, Steinberg Pro 12, graphics apps etc.
Protext 4.3
Protext 6.5 - both with manuals
Prodata
Superbase
Calligrapher - with manual
Microprose F1 simulator
Reach for the skies
Flight of the Intruder
Plus loads of other games and apps.
All original copies and manuals where appropriate

Oh yes, and a heap of STFormat, ST User and ST Review magazines.

If anyone is interested I am in Luton, UK.

If I've posted off topic here, please just say so.

Thanks.

Not that I know of particularly. These were both sites that I had
had problems with in the past and knew worked now. As I said in the last
post they relied on an undocumented action of CAB. I was just curious if
the ASH programmers knew about it or not ;)

>
>Planetarion is just great! thanks for the tip :-)
>

Does look like a really cool site. I've never had time enough to
play it except for the short period of time I was working out how the OVl
needed to handle the site.

>This of course means that the question still stands... what can the two
>alternative STiNG/STIK OVL's do or access, that the IConnect OVL can't ?
>

Well I am certain some mint people could supply you with SSL
sites, but I'm not going to bother. I'm personally interested in are
there any sites that can be retrieved with the Iconnect OVL that can't be
reached with mine.

Here is one that I would like you to try. Well not the direct URL but
it's easy to find. Can you use the form to request Yahoo maps. There are
alot of other map servers out there so it's loss is nothing really to us.
However I'm curious if the programmers at ASH found away to work around
CAB's get functions limited implementation for modern and wacky standards.

Here is one that I have an OVl in beta over as well. Can you view the following site as a web page.

http://www.cast.org/bobby/

As I warned to people this doesn't work with my released OVL. I have one in testing that fixes this problem though. Some of the recent changes have been modifications to how stuff is handled, so I've been throwing them to a restricted pool for testing before I find out that they cause serious problems.

Well I don't think you would use those two in conjuction. atz is
a reset. But in general it also depends on the variable you are setting.
Some use nothing, some & and some %

I always thought a modem init string generator would be a great
program for someone to write.

Dan Ackerman
aka baldrick

ps so the answer to your question above is probably the following init
string ATM0

some modems desire uppercase

Both had quality issues. Atari was just alot more honest with the
TT, probably because it was in production longer. There were several
revisions to the TT motherboard. I have a revision k, I believe. There
used to be great sources of information around here, who could quickly
list off some of the benifits and some of the downfalls to specific TT
motherboard types.

Now the Falcon however was a different story. As a developer, the
company I was working with received two developer machines. These were
great, Magic ran on them no problem, never a problem encountered with
either one of them except for the DEV TOS chip frying and falling apart on
one of them.

I think the first run of 10,000 machines were all of a fairly good
standard. I think they went with another and cheaper company for later
runs though. However I'm not certain there is any real way to tell what
run your Falcon came from.

>(while treacly) beats that pretty comprehensively.
>

I always found it funny the number of Falcon users that run in
this resolution though (640x480 4 bit color). When I ran on one I never
ran in less that 8 bit color unless I was running an ST app. Speed be
damned I wanted the colors ;)

>Mario's card is not supported by graphics card versions of NVDI AIUI
>(is that right?). That may well give people concerns. Which means a
>second-user graphics card needs to be sourced, which is often a
>problem...
>

That's a kind of harsh judgement on Marios Card. Let's put a few
things in order.

Mario claims it is probably the Fastest VME video card developed
for the Atari. Mario isn't one to over state. Having a Qwerty on my
system, I can say that his quality and support are 100%.

The Galaxy card ships with an fVDI driver. This is the VDI that
will be used by the fMax kit. It's still in development and all the
information about how to make your own drivers is available. NVDI however
hasn't seen an update in quite some time and only handles ET4000 cards as
far as atari graphics cards go. And then realisticly not all ET4000
cards. I have a Nova et4000 card on my machine and NVDI won't touch it
for love or money, even with quite a bit of experimentation on my side.

And here I think is the thing that really sums this all up. For
less than I paid for my used NOVA et4000 card a few years ago, you can buy
a NEW board that is SUPPORTED from a developer who is still developing for
our platform. And that new cards driver isn't locked up in some chest in
a trash heap near bremen. It's still being developed as well.

LONG LIVE MARIO! (may he never come to his senses)

coming down off the soapbox...

And the first person to market a PowerPC motherboard with open
specs and less than mercedes prices will be a very busy person. IBM
released specs for the CHRP board, but ommitted to manufacture a critical
chip until this year. Well actually I'm not certain they are
manufacturing them yet. They finally made one in the last 6 months.
I think it's the Northbridge. Development tunnel vision here again ;)

Anyway the PPC bundle chip that they are going to use on the Fenix
has a northbridge on it, but everyone in the PowerPC linux community thing
it is not really up to the job. So they aren't interested in using it.

There are alot of Apple motherboards out there for power PC's some at
laughably cheap used prices. However older cheaper ones require the Apple
rom to even boot the machine. I long thought this would be a lucarative
market as long as you operated underground and hid from the apple
attorneys, that market being a ROM chip with open specs that could boot
and address the hardware on the board. There was some talk, which I have
no verification on of newer apples coming out with no rom chip as OSX

won't use them anymore. I have no idea of if this is serious or has happened.

So yes I would like an open spec PowerPC board. There are several thousand people around the planet at least that would buy one with in a week if they could. However alot of people have put alot of time and effort into it so far with nothing to show.

Personally not being a hard ware Guru, I'm like you after going over everything that is thrown onto that chip you wonder what else you need to have on the motherboard. The slots for the PCI bus, connectors for the USB and Memory and of course someway to hook up a power supply. Too bad that the people who could do it won't bother <insert the name of any major electronics manufacturer> and the people who would like to, can't afford the initial costs.

Enough lamenting fo one day.

Dan

Mark,

The files are dated 7-6-92. The supfmt.prg is Supra Hard Disk Formatter
V4.10
and the suputl.prg is Supra Hard Disk utilities V3.11.

On my falc (internal 524MB HDD, 1GB external SCSI, CDROM) I am using a boot manager (Xboot) for the following selectable configurations:

1/ Mint/Thing with NAES
2/ Mint with TOS 4.9(?) (the developer's TOS/AES)
3/ Mint without AES ie as a console (csh)
4/ MagiC
5/ TOS with WinX
6/ TOS

and experimenting with

7/ MinT/XaAES <----- don't work - hangs

Use a boot manager, it helps alot!

Well I would have to say you either have a manufacturer that is
looking for a hook, or you have a very insane programmer on your hands ;)

However I can give you one pseudo clone example that has software that
works only for it and on nothing else... MagicPC which from time to time
will compile and run something that refuses to work on my TT until I
recompile it. So you see it obviously has any software that it has thus
munged that won't work on other clones. (MagicPC at work vs Magic on my
TT at home).

1512. TT Modem port II, 56k and Sting -getting it to work

Newsgroup: comp.sys.atari.st
Date: 2001-01-30 02:37:48 UTC
From: Alyre Chiasson <epinoche@nbnet.nb.ca>
Message-ID: <0Opd6.3486$TR6.109888@sodalite.nbnet.nb.ca>
Source record: 50947

I have read that port 2 on the TT can supports speeds up to 56K whereas port 1 cannot. I puchased a 56K modem and hooked it up to port 2. I have tried setting the Sting Port settings to Modem 2 and well as the General Port settings to Modem 2 but they revert back to Modem 1 even after a save. I have also changed the modem reference in the Dial.scr file to Modem 2. All of this results in a failure to connect with the modem. Anyone get this combination to work or can suggest what I should change? By the way, it does work on port 1 but at a slower speed - in other words the modem is okay.

Thanks

Alyre

1513. Microware OS-9/68k for the Atari ST

Greetings!

Would anyone happen to know where I might be able to acquire OS-9/68k (aka OSK) packaged to run on an Atari ST? And how much it will cost?

Thanks in advance!

John

P.S. I imagine this is heresy in this group, but I'd be interested in finding OS-9/68k for the Amiga or Mac (or just about anything else) as well... :-)

Use Serial 2 if you can, if you have a video card installed and
lost the ports go to a good electronics store and get a 9 pin serial port
back plane adaptor and hook it back up. You'll be much happier.

And if STiNG continues to give you problems with it, I can suggest
you try STiK2 as I use a 56k modem on my serial2 port with a dte of 230k
everyday on my TT with STiK2. But then again I think that my machine is
very similar to one of the programmers machines ;)

.... here comes the bull storming the china-store :-)

IMO there's a world of difference between being managable or working like a dream. The way that Papyrus treats long documents (>200pages) is enough to make a grow man cry or simply delete the whole lot from the harddisk.... Since I'm off topic here I'll just shut up, but I'm ready to discuss the "virtues" of Papyrus in another thread any day :-)

Or perhaps an Intel or AMD chip running MiNT natively ? And I mean
natively, no emulation for the OS. And yes, I know this isn't a
possibilty right now, but with a lot of rework, it could be. An
emulator could handle apps that needed it. That would probably outrun
all of them.

Just offering this alternative again. I'm sure most people still hate
this idea. So let the flames begin! ;-)

The idea is good. But a rewrite of all thing's TOS is needed, a bloody big job. I doubt that any one in this comunity has the resources to do it. I had hoped ASH would do it. MagicPC and all. There is the Tosx86 project, check http://www.volny.cz/phanatic/

1521. Programmers: Anyone want to produce a GEM metafile converter?

Newsgroup: comp.sys.atari.st
Date: 2001-01-30 09:52:14 UTC
From: jerrytmartin@my-deja.com
Message-ID: <9562scljd1@nnrp1.deja.com>
Source record: 50955
Cross-posted to: comp.sys.atari.st,comp.sys.atari.tech,maus.comp.atari.software

Hi all,

I have been banging my head against a brick wall lately. It appears the GEM-Metafile format exists in two formats: one supported by the Likes of ArtWorx and Calamus, and another supposedly the 'GEM standard' which is supported by Papyrus, Gemgraph and others.

The files show colour loss when imported across the 'boundary' - Papyrus shows ArtWorx/Kandinsky metafiles as only black and white, while GemGraph files import with the colours all messed up into ArtWorx/Kandinsky.

This is a horrific situation.

As the image data is all intact, the only problem seems to be in colour mapping, definition.

I guess it wouldn't really be too difficult to produce a converter which would alter the colour values appropriately?

Anyone out there want to take up the challenge?

This really is an unacceptable situation, and a program of this ilk would be most appreciated.

Help please!

Kind regards,

Jerry Martin

Hi All,

I am trying to use Atack's Amail for receiving/sending News Group postings. According to the Readme doc, it's a matter of defining a custom postbox in the CFG file. I've done that, but when I access news.zetnet.co.uk I always get, 'no messages'. The doc says call the mail storage string comp.atari and the mail box comp.sys.atari.st. I did, but the storage string got truncated to the 8.3 state comp.ata. Also there seems no provision for subscribing and unsubscribing from NGs. What am I missing.

Also, any work arounds for printing mails from EMailer?

Thanks in advance.

Bob King.

It turns out that Rom-Logicware have aggreed to look into the possibility of getting ArtWorx compatibility incorporated into Papyrus. Great news!!!

However, the utility might still be very useful. Anyone who wants to include e.g. GemGraph GEM metafiles in Kandinsky/ArtWorx documents (or modify them) will have the same trouble with colours. So there is still a need for this application as a 'first-aid' patch until the GEM standard can be finally set to rest!

Thanks all,

Jerry

I just want to compliment both Ulli Ramps of Rom-Logicware and Oliver Buchman of ASH for their willingness to help on this! You definitely don't find this level of support/concern for users on other platforms! ;-)

Don't bother, it doesn't work.

>Also, any work arounds for printing mails from EMailer?

Try on the lines of installing a viewer for the appropriate file names in
your desktop. I've got 1stGuide installed as the default viewer, it
displays messages but isn't able to print plain text.

You could always save the message as plain text and print it later.

>The 68060 is one of the reason why the clones are so expensive, these
>things really are not cost effective.
The proposed price of the Pegasus is between 1600DM-2000DM, which is not really cheap, a Milan060 would cost 2100DM depending from where you get the 68060.
Another point speaking in favour of the available clones are the drivers, you don't really think that the proposed USB drivers will be free do you? If you would like to connect a scanner, cdwriter or harddisk to these ports you'll need to fork out money... and i've got a feeling that they wont come cheap, assuming of course that these drivers ever appear.. otherwise you'll be stuck with a nice desktop based Coldfire 4e Atari clone, which will be pretty useless :-)

BTW: does anyone know the price for the Coldfire 4e? Motorola isn't exactly cheap, especially when it concerns brandnew CPU's

>The PPC and coldfire are *faster*, they just are, OK maybe not as much

.... ???? sorry, you've lost me here :-/

>Doom, Quake, High speed Multitasking, Papyrus, RayTrace (as mentioned),
>DTP (I imagine) compression could be faster, copying, and I think
>generaly my TT is running a bit slow for most of the things I do on it.
Of course these are a bit slow on a TT, depending if you're using an expanded TT (fast RAM and graphic card), a 68060 based Milan or Hades will do the job at least six to seven times faster (15 times for a Falcon). If you haven't got a graphic card in your TT, you'll be blown away by the speed of these two clones.

My point has been all along that there's no need for any *new* clones, the existing ones will do just fine.... all that people need to do is buy them instead of dreaming of vapourware. The argument that these clones are not available from their local dealer doesn't cut wood. The Pegasus will be just as difficult to obtain, no matter what Ulrich Goessel and co claim.

I've lost count of the postings here from people looking for a graphic card for their TT/MegaSTE. Now that the Galaxy card is finally ready I'm really looking forward to see how many people will actually buy it, I've got this feeling that it will be a lot less then all those postings, but that's the beauty of vapourware.... one doesn't have to commit himself.

Cheers from Belgium
Dennis

From: Dennis Vermeire <dennis.vermeire@gmx.net>
Message-ID: <980878570-186615AEicMi@gmx.net>
Source record: 50971

From: Glenn Bruner <brunergs@pcisys.net>
Date: Sun, 28 Jan 2001 20:24:40 -0700

Hi Glenn,

>I have a very early version of Magic Mac (1.04 I think...) that won't
>run on my PowerPC. Says I must have a 68030 / 68040 with a PMMU.
Version 1.04 ? where have you been hiding all these years?

>Any suggestions around this problem?
Yes, buy an upgrade from ASH, the latest version is 6.10.4

>I tried using the upgrade files from ASH web site, but they don't
>support the version I have.
These files are ment for version 6.10.4, they enable iMac DV and DV+
owners to use MagiCMac, these files are not upgrades but more or less
updates or bugfixes (depending on your views).

Cheers from Belgium
Dennis

>Define 'clone' ..... (moreover what is an 'Atari Clone' I
>can't run XE stuff)
I suppose that a few definitions are in order, not everyone has the same
opinion, and I'm not going to stick my ugly neck out...

>In my books, I would say it is a computer that will run the applications
>originally made for the original computer BUT it should have an OS to do
>this i.e. you can't say a PC running DOS but booting directly into Pacifist
>is a clone, if Pacifist was able to boot directly from the Harddisk boot
>strap then I would probably call this a clone so by this rational if
>MagicMac did not need MAC OS then I would call it a clone.
Well, that's in your books...
My book hasn't got that many pages: on a clone one should be able to run
TOS, MiNT and MagiC....

>If MagicMac did not need MAC OS then I would call it a clone.
Supposing this is possible, I don't think that TOS and MiNT users would
agree, MagiC is a TOS compatible OS, but it's not really TOS is it?

>A Falcon is not far off what you describe, it has different harddisk
>controller, different CPU, different graphics chip, different bus,
>different serial ports, different parallel ports, different floppy drive,
>different, different, different and the TOS was massively changed to make
>these items available, you then start to run SOFTWARE such as backwards to
>make ST Emulation more compatible
Take a look at the parts list of a Falcon, you'll be surprised how much it
got in common with the TT/MegaSTE. In general apps that don't work on a
Falcon wont work on the TT either... mostly sloppy programming is to blame,
if not how do you explain the apps that *do* work?

>And in my opinion this is all academic "beggars can't be choosers", what
>good is an OS with a 10 year old platform in this day and age?
Personally I would rather drop dead then to trade MagiC for Window$, OS 9,
Linux, Be... etc, ask the same question to a MiNT user and the answer will
be likewise.
I'm still here and crazy about this nearly 16 years old platform, meaning
that the OS and the platform suits me just fine...

Cheers from Belgium

I always work at 44.1kHz, so that should be no problem.

> I could imagine there may be problems either if you have an accellerator
> which isn't completely stable installed - or if the CPU-clock modification
> hasn't been made.

IIRC I did most of the experiments before the CT2 has been installed
but after the clock patch. I'm not sure whether the clock patch was
done 100% okay because I think there were sporadic SCSI problems
even after the modification (but very very seldom) but I don't
remember a single SCSI error since CT2 has been installed.

> Otherwise, it could be as you say, that you haven't found a "quiet" passage.
> The best place to find the right spot is just before the music starts - and

> too much of the DeNoiser effect either - then there's risk to start to
> destroy the original music too...

Do you remember to what percentage of reduction you set the slider ?
I think the problems started when I set it to more than 10%.
BTW, I always marked several passages, but each of them quite short.
Maybe that was a bad idea.

> When I tried the program, I also had the first model of Behringer's DeNoiser
> (rack unit for studio use) and the DeNoiser program for Falcon actually
> sounded better and didn't remove as much treble as the rack unit when both

Have you ever used a PPC Macintosh without L2 Cache?
They are painfully slow, even with 225MHz processors.

Source record: 50964

Hello,

For a study and comparison with the future CT60 performances, I'm looking
for the RAM bandrate (READ & WRITE) with the following machines :

MILAN 040.
HADES 040 : FPM ram (no EDO).
HADES 040 : EDO ram (updated hardware).
HADES 060 : FPM ram (no EDO).
HADES 060 : EDO ram (updated hardware).

The measures must be taken with NEMBENCH from TITAN (is there now a better
soft ?)...
I don't want GEMBENCH results !
Send me the results files.

Thanks a lot !

Well a fussy program on the TT can have the same effect,
turn off the cache and the TT crawls. Perhaps less likely
but I've had it happen. ;-)

I agree with this one paragraph. I also took action and
got the Hades060 as most already know. I hear alot of talk
and not to many walking the walk. So when will you take your own
advise?

I don't know who stated a TT with a gfx card was good enough,
I have a wacked out TT. The hades makes the TT look like slow
motion "at all times". The Hades blew me away, I have them side
by side, set up near identically so I am not mistaken.

This is not directed at anyone in particular, but I think some people
are passing judgement about equipment they have never used on a
daily basis or perhaps never even seen. Based purely on articles
stating this is x times faster than that... blah.

>http://www.volny.cz/phanatic/

I have seen this project. It looks very interesting, but I don't know
if it'll ever be completed. You're right, the job to convert TOS to
x86 is an extremely difficult job and I doubt it could get done unles
a whole pile of programmersdecided to try it. And considering the
hatred many people have for the x86 hardware, it'll be impossible.

It would be really intersesting if MiNT could be ported to the x86
along with TOS with some minimal low-level emulation, still using TOS
as the ONLY loaded OS. Then a program similar to Digital/Compaq's
FX!32 could be used to run the 68k apps on the system.

Is anyone familar with this software? It is used emulate the x86 on
DEC Alpha platforms. But instead of just emulating, it slowly
translates more and more of the software to native Alpha code so that
the program operation speeds up a little more each time it's used
until, finally, it is all Alpha-native code. Neat process.

Maybe they should consider implementing something like this on the
Pegasus or the Tempest. I thought something like that might actually
be under development for the Tempest, but I really don't remember.

Just some thoughts! ;-)

>just mention that Tempus Word Pro can do it also :-)

Hnn, I wouldn't necessarily subscribe to that point of view! It's one reason why HTML is in danger of becoming something it wasn't supposed to be because some browsers accept and interpret incorrectly-coded pages. The fault then goes unrectified and more and more browsers then have to accept the fault and the fault eventually becomes part of the HTML specification!

The blame lies fairly and squarely with Artworx if it is producing incorrect files, the other programs you mentioned are a bit lax in interpreting what they're supposed to be. I reckon the makers of Artworx should be persuaded to correct the fault first, or if they could provide a utility to convert incorrect files.

I have a similar problem with Papyrus and fVDI actually. A certain fault, only when fVDI is running, causes Papyrus Office to crash when trying to run a report. I have to disable fVDI and run Papyrus in low resolution and 16 colours :-(

I contacted the author of fVDI, who very kindly loked into it and traced the fault to an incorrect function call in Papyrus which exploits a bug in the original VDI. Since fVDI is a 'debugged' version of the VDI, Papyrus fails with fVDI.

So...should fVDI be persuaded to reproduce the VDI's bug, or should Papyrus be persuaded not to exploit the bug? While this debate rages on, I'm still left with an unusable combination of programs.

a > drives would be optional.

I'm not looking to incur any expense on the drives. They are Toad Tower boxes with a tape drive in each. One has an Adaptec 2940 and the other a Link II to interface with a ST, STe, etc. The 1.1 gig was the hard drive on my Bear Cavern BBS which I shut down some months ago. It must have 1000+ files on it and I now want to give them to someone who could use them but I want all of my personal files removed. It saddens me to think I may have to destroy them. I plan to try to put the drives into my Windows box and do some deleting. It is also set up with SCSI drives. Also in the package are nine tapes that have multiple backups of the drives. Without a ST I'll have to destory them.

BTW what do you mean by "via emulation"?

Well, it has been a while :-)

Did I mean a blitz copy gadget? It's the hardware that Power Computing
devised to allow direct disk>disk copying. Although it's a little
redundant with the internal HD floppy.

Why must TOS (or MiNT, or MagiC...) be converted? It could very well run under the same 68k emulator as the apps would do. Hardware drivers (or atleast part of them) would be x86, and this is enough to get it started. Even if *everything* runs under the CPU-emulator it will still be faster than anything we've seen before.

Later, when the userbase grows and things starts to settle down, one could gradually port the OS and apps to x86. Or even better, some sort of meta-CPU like the new "Amiga" seems to be using. Then you wouldn't be restricted to the x86 either.

Then try turning off the caches on your TT ;-) The cache contributes a lot
to a computer's speed, and should never be switched off. Speed tests
without the cache enabled is like running a Viper on its starter motor and
complain about the poor handling and lack of speed...

OK, I see what you mean: You want killer apps that take advantage of the Milan's faster CPU, accelerated graphics etc. to such a degree that they don't make sense on lesser hardware. I don't know about any such application today, perhaps except a few game ports.

The problem with these is basically that they're huge and complex project, and with the very limited resources we have at our disposal now, it will take time to develop such applications. But I can assure you that you'll see some rather heavy ports (mainly games and X-apps) the very moment we have hardware to run it on.

> No, what I would like to see are applications that are written exclusively
> with the 68040/68060 in mind.

That doesn't make sense.

> Why does a PC or Mac user upgrade his machine frequently? it *could* be to
> run some of his apps faster, but more likely it's because he wants to use the
> newest apps which require a faster processor to run. A Pentium 200 may be

There's three main reasons for upgrading a PC:

1. The next version of Windows, which needs four times as much memory and disk as the previous version.
2. Games!!
3. The ever decreasing prices on already ridiculous cheap hardware.

> The above situation is something which we as Atari users have hardly ever
> known. Except for some specific Falcon software, when we upgrade to a faster
> machine it's simply to run the apps faster. For some of us this extra speed

I disagree. More memory, faster CPU and better graphics means that one can build much more complex systems, and do much more simply by combining existing software. And the applications gets more and more complex, despite what you seem to believe. Look at the difference between 1ST Word Plus and Papyrus, the two defacto standard word processors from two different eras.

> is essential, but the general mood here is usally that it's not such a big
> issue. Someone who uses a CT-2 Falcon or expanded TT has no real incentive

It will require a more powerful CPU than any of the current and planned
clones or accelerators can provide. Besides that, Netscape needs 90Mb or
so just to start.

> Why have so many people bought a Falcon when on paper the TT is much better,

>>>The resource editor Interface 2.30 resource file (MISC section)

Derryck, there seems to be something slightly incorrect with the English resource for Interface. Apparently it doesn't do any harm, but may signify some hidden problem: when one selects Quit from Interfece's menu, the clipboard icon on Interface's desktop gets redrawn a little bit to the left of the previous location, over the old icon so that for a second it appears as there are two clipboard icons. This does not happen with original German resource file.

(btw. this was noticed on a MegaST with TOS2.06)

Cu.

> Mario's card is not supported by graphics card versions of NVDI AIUI
> (is that right?). That may well give people concerns. Which means a
> second-user graphics card needs to be sourced, which is often a
> problem...

First of all, the Galaxy can work with NVDI's 16 bit driver, but ofcourse without any of the acceleration that the card offers. It should still be quite a lot faster than a Falcon running in 16 bit resolutions though, since the Galaxy's RAM doesn't share the bus with the CPU and DMA sub-system like the Videl does on the Falcon.

Then there's the fVDI driver, which use the card's built-in "CPU" to accelerate output a *lot*. I don't know if this driver is finished in this respect, but I know that it works already.

And if you absolutely need NVDI too, you can run NVDI on top of fVDI and get the best of both worlds - fVDI's accelerated driver and NVDI's outline-font and printer support. I've been using this combo on my Eclipse for a few months already (although I've stopped using NVDI now, as fVDI replace GDOS as well. And it's a lot faster than NVDI since it use the facilities on my RageII graphics card).

For all of you that doesn't know how much difference an accelerated graphics card can do: I recently ran VDIbench on the Videl using NVDI 5.03 on my Falcon/AB. The polygon-test was very, very slow, I could see each and every polygon being drawn and filled. On the RageII - using fVDI and the RageII-driver - the polygons were drawn so fast that everything was just a blur. It's not possible for the human eye to detect that the polygons are drawn, they just completely drown the screen at an increible rate. We're talking about tens and tens of thousands of filled 16-bit polygons per second here, imagine what that can do to 3D games on our platform.

> > I don't know Explorer32, but the Falcon is generally more
> > compatible with older ST software.

> Strange... I'd say the other way round by quite a way...

The Falcon is just an expanded STE with the same memory layout, same bus and very similar hardware. The TT is very different, it's a true 32 bit computer with a real 32 bit CPU.

I don't think you got my point: MiNT could still be the native OS on a
x86-PC, even when running on a 68k emulator. This is how e.g. MacOS worked
when they made the transition from 68k to PPC.

And when the cache was off, was the superscalar also off? If both of
those are off, the 060 is not a very fast chip. The secret of its speed
lies in the cache/superscalar capabilities. So, this did not come as a
bomb ;-)

I think that was the precise point I was making. The TT, as far as I
know, does not have caches, the Hades does. The TT uses a '030 at
whatever MHz, the Hades a '060 at some more MHz, yet with the Hades
cache off the speed was the same.

Ah - OK. When talking about a "patch", I usually think about modifying the
OS without access to the source (and thus without a clean integration).

Anyway, porting TOS to a CF without emulation would be hard work: there are
lots of assembler parts in TOS which I did not need to touch for the
040/060, but which would definitely need reworking for a CF port - or you
could run these through the emulation, too, but that would probably not give
a very good performance.

It does - the 68030 has both data and instruction caches on-chip. Otherwise
it would make no sense to run it at 32MHz when the TT's bus only runs at
16MHz.

However, the caches are quite small compared to these in a 040 or 060.

Have you tried running ICDBOOT.PRG from the desktop after booting with
HDDriver? I'm sure I got HDUTILS to work this way at one time...

The answer is to use atzm0. You only need to use "at" once if you want
to string commands together. A further example of chained commands
might be:

Init string:
ATL1S38=5

Hangup modem:
ATH0&C1Z

Can't help directly, but does this translated quote from Uwe's README
for HDDRIVER 8 help?:

PD drives can be set to two operating modes: Mac-compatible and
PC-compatible. Both can be used on an Atari. In Mac-compatible mode the
PD drive occupies a single SCSI-ID with logical device number 0 (LUN0).
In order to be able to address PD media as well as CD-ROMs, the hard
disk driver and the CD-ROM driver must manage the same device. In the
PC-compatible mode the PD drive registers itself twice, namely as an
optical drive under LUN0 as well as a CD-ROM drive under LUN1. In order
to use a PD drive in PC-compatible mode one needs a CD-ROM driver that
can access CD-ROM drives with the SCSI logical unit number 1 (LUN1), for
instance SPIN!. If the PD drive is used in Mac-mode, you have to switch
on 'CD-ROM Drives like Removable Disk Drives' in the 'Removable Media'
dialog.

Whether a similar thing applies with IDE drives you'll have to ask Uwe.

Regards, /Peter/

Hi Dennis!

I don't really see the point of this. Surely equivalent applications will exist on the Intel/Mac platforms? To my mind the only reason for sticking with Atari is that I don't want to start learning a new operating system, and I want to be able to run my huge collection of existing software. If the new 'clone' or 'emulator' does not run most of them, it is of no interest to me. I suspect the same goes for most other Atari users. Sure, a few are interested in screwing the most they can out of their machines with hardware upgrades (I have a Nemesis in my Falcon) and a few others seem to think that a 'real' Atari (whatever that is nowadays!) is a must, but most would be content with a compatible machine that has a better browser that understands Javascript. But, I repeat, it MUST be compatible with the majority of well-written software.

Mapquest works fairly well. Yahoo maps was the last time I really
used it, was just an overlay onto mapquest with an extra option or two.
Also never count on the directions it gives. We had quite a fun time on a
slow day getting driving directions to places we knew how to get to. Sometimes
they were only off by 2 or 3 houses + maybe the side of the street. Other
times we were getting things that would put you in the range of a mile or
two away from where you wanted to be.

I'm trying to remember the trick with mapquest but it's escaping
me. Basically there is one route through of requesting the information
that will almost always pull your map up for you. Other routes vary in
effectiveness. I grabbed a bunch of maps off it in November. I think
it was the driving directions that didn't work if you wanted the map as
well? I'm not certain, would have to give it a few tests and it's past my
bed time for this evening ;)

1570. Help needed making disk images

Newsgroup: comp.sys.atari.st
Date: 2001-01-31 05:34:56 UTC
From: Josh Renaud <kirkman_NOSPAM@umsl.edu>
Message-ID: <B69D0020.A057%kirkman_NOSPAM@umsl.edu>
Source record: 50904

Hello all..

I'm using an iMac and Philippe Gerin's wonderful Nostalgia and PowerST emulators. I use the utility DUST to convert my Atari disks into .img files for the emulators.

Unfortunately, I no longer have my 1040STe. There are several programs I've downloaded from the internet that I'd like to convert into disk images, but I can't do it because I can't copy them on Atari disks.

I thought that maybe I could format a PC disk and copy the files onto it, then use DUST to make an image of the PC disk. But it hasn't worked.

So, I'm wondering if some kind person might be willing to make 1 or 2 disk images for me. I'd be happy to email you the files if you could put them onto a disk and then convert them into an .img on a Mac or PC and send them back to me.

Thanks so much for your help!

Oh yes, the 030 also has caches. Altho the 030 caches are much smaller
than the 060 caches, they are there and make a big impact on the 030's
performance.

Hi Derryck,

bad news about aMail, particularly as Jan Krivanek sent me a very upbeat response to my query to him. Does it need Mint etc and LFNs? A query to MyMail got the response that the NEWS part is on the long term agenda, but don't hold your breath. Your advice is the same as another of the DDP gang, Dennis, great minds think alike!!!. I have installed QED as both the Editor and Viewer in Jinnee and it works. I still miss the 'extract binaries' of Newsie, when the binary is embedded in the message, not with a JIF header I notice, (further encoded??) but if it's ASH's policy to be lean and mean with their Magic applications, for compatibility with the low end ST, then I suppose it's better to have the essentials working well than a lot of additional facilities working so so.

All the best,

Bob.

Hey everyone! I'm running MiNT on my TT equipped with a parallel ethernet adapter and a SLM804 laser printer. I also have my PC sitting nexrt to the Atari. I was wondering if, using MintNet, there is any way to get my PC to print through the TT over the ethernet network. I don't want to have to convert my files on the PC and copy them to the TT. I would much rather have the SLM show up as a network priinter or something similar. Has anyone done this and, if so, how do I set this up? THanks for any help in advance!

Maybe we should appeal to developers of once and future emulators of Atari on PC- to do a few steps more and make something like PaCifiST, STonX or TOSBox completely (D)OS-free and able to use all peripheral ports.
Or nicely ask the emulator-developers to release the sources, if they do not want to develop any further, so some enthusiast may work on. Only STonX source is currently available AFAIK.

On the other hand, maybe it would be good to keep just the barest core of DOS hidden somewhere within the emulator, just for the sake of device drivers- so the existing DOS drivers for a multitude of devices maybe might be used through the emulator (or whatever it be called)- the problem with developing new drivers is that they would be needed now, not in 2010.

Out of curiosity, has somebody compared the real speed and Atari-compatibility of a clone like, say, Milan (or even a TT with a graphic card) vs. a fast PC with a PaCifiST, STonX or TOSBox? Is the compatibility of a current "emulator" really much worse than that of a current "clone"? Which crucial applications do not run on emulators and run on clones (ok, I know that emulators are currently 68000-only, but that's not a fundamental limitation)?

>Can't be done on chip. Need's at least some form of i/o to get running.

Not necessarily. All you need is some RAM to get the emulator running, then
the emulated m68k code can initialize everything else just as on a real 68k
CPU.

Agreed, for debugging some minimal I/O might be nice, but it is not required
for operation of the emulator, provided the emulator is the first thing that
is started by the reset code in ROM/Flash.

That's false ! The V4e needs an emulation with a library !
We asked to MOTOROLA and READ the ANSWER !
Please, stop to dream and repeat that the V4e is compatible with the 68K !

Conclusion :
The futur V4e will be less powerfull than a 060 to run our current software.
It is so evidence that the future of atari computers must be thought with
some very more powerfull processors like the PPC, which when emulating 68K
is more speed than the 060, and consequently than the Coldfire V4e !

You don't need anything more that what you need to bootstrap the OS
anyway.

1585. Alphabetic sort

Newsgroup: comp.sys.atari.st
Date: 2001-01-31 18:33:12 UTC
From: Steve Sweet <steve_sweet@madasafish.com>
Message-ID: <980962762-729183AEicMi@madasafish.com>
Source record: 50923

Hi guys

Does anyone know of an application that will allow me to sort grouplist
from newsgroups servers into alphabetic order?.

When i get the whole list from the IP its all nicely sorted, but as the
list gets appended it gets a bit of a mess and can cause some problems.

If there is no specific software to do this then i lay it down as a
challenge to the Atari coding fraternity to come up with something. :-)

The interface wont have to be anything special, a TOS windowed prg will
do that preferably makes a backup before it gets busy. If you want to get
flash then a list that allows deletion of chosen groups and maybe even
some search facility would be a nice touch.

Agreed. I don't know why that should be.

This resource was formerly included in the commercial version of Interface
sold by Compo, so if there had been a problem I'm pretty sure that it would
have come to light :-)

Thanks for the report.

The TT has caches too, and just like with the 060 and 040 - don't switch
them off ;-) They're there for a reason.

Try a-to-z

A-Z (pronounce A-to-Z) is a GEM program to sort a text
file from A to Z (or vice versa). Supports: GEMJing,
BubbleGEM, OLGA (Client/Server), ST-Guide and VA_START.
Bilingual release (German/English).

The author is Matthias Jaap.

> I suppose that a few definitions are in order, not everyone has the same
> opinion, and I'm not going to stick my ugly neck out...

I agree, I also think that people are much stricter when it comes to their beloved Atari (including me but I am trying to change my ways).

> My book hasn't got that many pages: on a clone one should be able to run
> TOS, MiNT and MagiC....

Also agreed, a clone should be as compatible as possible but then it should not also be confined to the above OSes, some here would be very upset if there TT could not run Linux and even Atari made a version System V. Why should the reverse not be true? The point is a 'PC' is not a Win box or Linux box, etc it is not more than a box (OK AT Compatible) but why can't we exploit it?

> >If MagicMac did not need MAC OS then I would call it a clone.
> Supposing this is possible, I don't think that TOS and MiNT users would
> agree, MagiC is a TOS compatible OS, but it's not really TOS is it?

Mint Is Not Tos either, lets not forget its origins, OK the point being is if a version of TOS booted directly on a MAC or PC then I would class that as a clone.

> Take a look at the parts list of a Falcon, you'll be surprised how much it
> got in common with the TT/MegaSTE. In general apps that don't work on a
> Falcon wont work on the TT either... mostly sloppy programming is to blame,
> if not how do you explain the apps that *do* work?

I forget what the original point was but something along the lines of clone compatibility, etc. It was about similar components and how far one can stretch them - i.e. migration from old hardware to new such as 68000 - 68060 - PPC.......

Well I believe the reason some apps work and others don't is a combination, yes sloppy programming has also meant that some software that runs under TOS 1 will not a TOS 1.4 machine, or a ST520 compeered to a ST1040. Another reason may be compatibility between newer hardware and older stuff e.g. a 68060 is not 100% compatible with a 68000, the instructions are simply not the same (in that not all of them perform the in the same way). The word 'clone' maybe overstretching the truth some times.

> >And in my opinion this is all academic "beggars can't be choosers", what

> Linux, Be... etc, ask the same question to a MiNT user and the answer will

> be likewise.
> I'm still here and crazy about this nearly 16 years old platform, meaning
> that the OS and the platform suits me just fine...

Me too, I would never suggest that someone drop TOS, etc for any of the others but I also think that these OSes need to expand and grow and at present they are limited by user base and hardware. No TTs, Falcons, etc are being built and have not done for many many years shear limitations on hardware available to run such software is becoming hard to find, my TT took me a long time to find and when it breaks I am not sure I will find another.

Mark.

1591. 2 hard drives and stuff

Newsgroup: comp.sys.atari.st

a > Ah, I see, you wish to give away the files, not the hardware.

I wish to give away the two SCSI hard drives which are in seperate mini-tower boxes and they each contain a tape drive. One has a Link II and the other has an Adaptic card. I'd like to leave all the NON PERSONAL files on them which on the 1.1 gig drive are in excess of 1000 files for Atari, MS-DOS and Windows. The 1.1 gig drive was used as the file library on the Bear Cavern BBS which I took off line about 6 months ago due to lack of callers.

One of these days, soon I hope, I'll try putting the drives into my Windows Computer which has SCSI drives.

Yes the TT has caches, but only those on the 68030 itself. The MSTe
has an separate cache as the 68000 has no on chip cache.

The way to do it would be to load JUST a command.com and then run some sort of Emulator. In theory you can alredy do that with Winston, but Driver's for video, NIC, and sound etc are the problem. It still need's a complete rewrite.

And that will double it's performance. A 68000 at 16Mhz is NOT twice as fast
as a 8Mhz variety. But it IS with cache on. Just show's how important it is,
eh.

For the TT, use DRVIN, then MFP_TT (for SErial 2 port for Internet) and
SCC if you also use Modem 2 (as I do for amateur radio packet, 9600 bd):
I use both at the same time. These must be before STinG/STiK/Sockets
progs.

I think the English tranlations for the HSModem docs are on Derryck's
site, whose URL I cannot remember, of course.

All the best,
Charles.

1601. Re: Terminal Program and CDROM drivers

Newsgroup: comp.sys.atari.st

Source record: 50916

When I bought the machine there was a Crazy Dots VME card in the slot (don't get me started on that one), so it would appear that I am missing a number of ports and have only been left with the 2 under the PSU and the LAN port to the left..

What I want to achieve is a fast connection via serial to another computer AND (maybe without swapping ports) a 33.6 or 56.6 modem connection.

Seeing as I have only the 2 (9 pin) ports mentioned I take it I should be using the SCC program?

When I use the Connect program non of the settings come close to any other standards under Terminal, is this because I was using the MFP version or what?

What settings should I use for the SCC program (there are a number and the English instructions did not really help)?

Mark.

1602. WANTED: Megamax or Lattice C compiler for Atari ST. North America

Newsgroup: comp.sys.atari.st
Date: 2001-01-31 23:42:05 UTC
From: Peter Willis <peterw@borstad.com>
Message-ID: <Gxme6.136053$47.2071201@news.bc.tac.net>
Source record: 50820

I'm looking for Megamax or Lattice 'C'
for the Atari ST.
I am in North America.

I am also looking for an Atari Hard drive that is compatible
with my 1040 ST FM.

Thanks if you can help.

Peter

1603. Re: Biggest drive on an STe

I could be wrong but I think we have approched this from the wrong end.

When we talk about the limitations on size of partionings we should remember that this is TOS and NOT the driver/partitioning software such as HD driver, ICD, etc. Even if TOS can not use the partiniongs the software should still see the unit, this is more likly to be a hardware problem.

Ideas could be termiantion, parity, ID or simply not pluged in properly, there may also be a very small number of STEs around with dodgy DMA chips (very unlikly).

Ealry TOS could only see up to 16 MB on a partition, later they inporved this along with a number of other problems such as folder depth, etc. There are many patches out there but I think that modern drivers such as HDDriver will replace and patch these areas for your (could be wrong).

The type of interface that you are using would be helpful?
Version of HD Driver?
TOS Version (maybe)?

Mark.

Rodolphe,

If someone would design a PPC based TOS (MINT, Magic WHATEVER..
etc) system.. I know people would prefer that over the Coldfire. But
for now.. this is the only offer we have.

Why don't you get together with the XTOS/Medusa guys and create a PPC
computer together? Then the Atari community will get the true Atari
computer it wants!

With both groups working on the same project it will help create
a "Standard". I know you have the PPC Riored, so you do have a head
start.

it was just a thought.. so don't trash me!

Ah, I see, you wish to give away the files, not the hardware.

Anyhow, Gemulator Explorer can read Atari HDs on a Windows system. A
working demo is at www.emulators.com .

I have just installed the original Multitos o.s onto my Falcon,and I want to get the mint-net files so that I can access the internet with it the trouble is that the only file that I found was a:tar.gz,or something like that,is there a Zip file of mint-net so that I can install it as easily as the Atari multitos disk was.I usually run Geneva/Neodesk Sting/MyMail/Cab,but there is no message piping so I can't for example click on a URL in a MyMail email and get sent straight to that site in Cab,which is what I want to do,as well as create web pages in Everest and have them appear in Cab via OLGA.So basically I'm trying Multitos to give me more functionality in this respect.How do I read read a tar/gz file ?,or preferably where can I find a simple Zip of Mint-net to get Sting dialler working again ? HELP !

Perfect beautifull idea.

I vote some weeks ago (http://www.atari-home.de) that milan/medusa
people should speak together about a new payable hardware. But i think
thats simple on the same way as it is by software projects.
Strait down to trash.

Since years it looks for me that NOBODY like to talk with any other..
Anybody brewed his own soup. More as one example around.

One of my family had a (bad, bad) ;) message for:

"Hier riecht es wie im Altersheim" :->

Anyone may translate that ;->>

Pity - I'd have thought it would have been something people would've crowed about when the TT was first released in 1990 - the "mine is the only one that works in TT RAM" self-promotion one tends to notice when a new/different machine comes along.

Thanks - I'll see what it's like when I download it from the PC to the TT.

(BTW: Would there be any point to me spending some time and writing a reset-proof TT-RAM ramdisc when I finish the stock controller program I'm currently working on?)

Grab MagicSLM from the MISC section of my website, URL in sig.

I can't see that you'd be able to network it in the way you want, but:

Basically this utilty allows you to print to your PC's HP 300dpi driver set
to output to the serial port, which this utility collects, massages to SLM
codes and sticks it out the DMA port to your laser.

In your case, you'd print to a disk file, get it over to the TT by whateevr
means, and use MagicSLM's print from disk file option.

HTH.

Just to remind: also the 68060 CPU does not use the exact same instruction set as 68k,
and also needs software library to emulate many instructions formerly supported by
the MC68882 floating point unit (same applies to 68040), and also needs software

library to emulate such instructions as new multiply/divide or cmp2 introduced in the 68020.

However, these instructions are not so often used, so that a 68060 based system can
actually do excellent and fast work executing 68030 programs. 68060 is able to do
sinus calculation faster in software, than MC68882 did it in hardware, by the way.

So, such an information, that "this is a subset of 68k instructions", is not a reason to reject
ColdFire processors as possible hardware platform for the future. To make such a decision,
one should know first, what instructions are exactly missing, because it for example might
be BFFFO or other such "useful" stuff.

At the other hand, if the compatibility is relatively high, the migration may be done off the
68060 system, without awaiting until the ColdFire v4e appears on the market.

I would like to see the v4e users manual, rather than that press release note, which is for
journalists and explains nothing :<

1617. Correction about NVDI 5

Newsgroup: comp.sys.atari.st
Date: 2001-02-01 13:42:04 UTC
From: baldrick@dilbert.netset.com
Message-ID: <3a7967ac$1_2@athena.netset.com>
Source record: 50803

I made an incorrect statement about NVDI5, that I wanted to
publicly correct.

I stated that NVDI5 only ran on atari graphics cards that used an
ET4000 as the video card cpu. This was not correct. I had made an
assumption about some of the graphics cards I did not know based on the
ones that I did know.

NVDI5 can directly drive Matrix cards that use COCO chips as the
main processor and others as well.

Sorry for being the source of misinformation,

Dan Ackerman
aka baldrick@netset.com

Hello,
A list of instructions of the Coldfire 5307, 5407e, an article
about the Coldfire from the French Atari mag ACC as well as
comments about and possible solutions for the Xtos project
(under "info's) can be found on :
http://www.coldfire.free.fr

Most of it in French !

Cheers,
Dan

Speed is not that good, a Hades or a Milan would bet them hands down but
saying that they are not either.

The main problem is that (most) do not support things like high resolutions,
etc as they are just ST emulators and not Flacon or TT emulators. I think
TOS BOX would probably be the best at present.

Anyone got the source for Winston, wonder how hard it would be to get it to
talk directly to the BIOS rather than through Windows? If you can do that
then you have a 8086 Clone.

Mark.

With the above threads having a mixed response (mostly negative about the Coldfire) and Rodolphe CZUBA (Czuba Tech) also believes it is a dead end, when will the developers of the XTOS machine join in with these discussions and clear these things up.

I really hope they can make it work but I think I need some reassurance about this.

Mark.

No, this means having to deal with DOS. Instead of loading DOS, you should
load the 68k emulator instead, and then boot the real OS on that.

> video, NIC, and sound etc are the problem. It still need's a complete
> rewrite.

We already have drivers for PCI graphics cards, sound cards, SCSI cards
and ethernet cards. These would only require some basic support in some
sort of BIOS and perhaps some slight modifications.

Who would like to see a PPC Atari, lets give the developers some idea of the numbers involved.

Put me down for at least 1 if not 2.

Mark.

1624. WTD: Atari TT or Falcon (US) could possibly go for a Mega STE

Newsgroup: comp.sys.atari.st

From: mhill <mhill@hillsoftware.com>
Message-ID: <67fj7tc0cpupvnfutafgvga0n4d2ctg8dv@4ax.com>
Source record: 50812

Hello,

I know availability is tough on these bad boys, but......

I'm looking for an Atari TT (my first choice). Not concerned with
memory configurations. If it has a Crazy Dots card even better.

Also looking for a Falcon or Mega STE.

Any sellers who have any of the above please email me and let me know
what you have (working non -working, etc), and I will get back to you.

Mike

```
Hi Bob,

My CapsLock LED works ok but the NumLock key is meaningless to TOS
since I dont think even the Milan version uses the numerica keypad
as cursor keys.

I never understood why this facility is still available on PCs it's
just a nuisance. But then we are dealing with the people who added
extra keys to use the menu !!!

Hi Hallvard,

HT>Tell me more about this.
I don't know too much about that, sorry. A friend of mine owns one but isn't able to locate it right now, for he's desktop publishing with his PC, and his falcon is sleeping. :-)

If you've got ACOPY.PRG, very old copy program, you might getm ore information.

Synchro is hardware that has to be plugged in the external floppy jack and in the cartridge port (in Germany applied to as ROM port) of an ST. A second floppy drive (no HD!) is needed though you won't have a drive B at that moment.

Then you start ACOPY that speeds up the two drives (internal and external) so that they have will turn at the same speed with narrow tolerance. Afterwards the internal floppy is copied to the external one track by track...

I'm sorry I don't know eitehr the producer nor a retailer of that hard/soft package... It's a small (chocolate size) board.

Ask for it (Synchro Express). Maybe someone has got it and is ready to sell.

Maybe you could try PROCOPY, an old and even free (but not so 'hard') copy software (ST only).

Und TTschï¿½
ps

1627. Wanted: Mega ST 4! Pay upto $100! Buy or Trade! USA only!

Wanted: Mega ST4. Willing to pay up to $100 U.S. Read on if interested!

Looking for an Atari Mega 4 ST. Please, no upgraded Mega 2's. I need a
stock 4 MB Machine Plus a TOS 1.4 upgrade would be nice. The important
feature is this. The built-in floppy must be the Chinon (I think that's
the name). You can tell, the drive has an eject button centered under
the slot of the floppy. The button is wide, short and slanted on both
the left and right side. And the case needs to be unaltered, not cut up
to replace a drive with an incompatible button. Mega 4 ST with a bad
floppy considered? As long as the case is right. Please direct your
reply through E-Mail to atari@pacifier.com or call Ben at:
(503)256-9974. I need to keep this transaction solely in the U.S.

P.S. Some have asked me "Why do you insist on a Mega 4 ST? Why not a
Mega 2 ST upgraded to 4 Megs?". My answer, I had a Mega 2 upgraded to 4
Megs. The upgrade failed and I don't want that again. I don't care if
Jack Tramiel himself upgraded it and Guaranteed it. I wan't the Mega to
come that way from the factory. I don't trust most of other peoples
tech work. I'd rather have the RAM put in at the Factory.

I would, but only if it's Falcon-compatible enough to run Cubase Audio. This is why I'm really hoping the Tempest comes out. Even if the Tempest isn't able to run Cubase, I could still run it on the original 68030, and have a nice speed boost for my other software. But if one could get, for example, a G3 or G4 machine, with 56k DSP compatibility (either hardware or software driven) that was compatible with Cubase, had a DSP port for things like the Cubase Audio Clock (for 44.1khz) and JAM In/Out (or maybe even had compatible 24-bit in/out audio ports, with 1/4" jacks built-in), then I'd be one of the first in line! Oh yeah, having it available in the U.S. would be a big plus, too...

Basically there are a few about, Syncro Express and Blitz Turbo come to mine
but there was also another which you could build yourself (very easy).

With the above you need an internal and external floppy drive plus the
additional bit of hardware (there were 2 versions of the Blitz Turbo, the
2nd being crap), these devices often plugged into the printer port as well
as the floppy. Software will then do a very very quick and 'good' copy of
the disk, I think Syncro was the best as this had a very accurate copying
method (which took hours).

I think I may have the software and hardware for all the above, I will try
and find the one that you can build yourself and you can have a go.

I don't know if this is going to help your MSA file problems though.

Mark.

I have the chance of getting a couple of STs and an Atari PS3000 monitor.
What is it really? It's supposed to have a built-in disk drive. Can anyone
shed some light for me please? Thanks.

The PS3000 is a monitor that had a built in disk drive like you mentioned. It was built in under the monitor and was only a 360k disk drive(single sided). The monitor was a JVC. It also has a BIG block of a power supply that weighs almost as much as the monitor itself. Ive opened a couple of them up and it looks like a second drive could be added (if I remember correctly). The only thing preventing the 360k drive from upgrading to a 720k drive would be the fact that Atari used a weird edge connector on the data cable of the disk drive. On the back of the monitor was a port to hook up the disk drive to the ST and the power supply plug. It also had a built in speaker. Overall the monitor is a great monitor plus you get the floppy drive that doesnt take up any space.

The original MagicSac Mac-emulator adapter from Dave Small. Has the Mac ROMs installed. Likely needs a CR2032 battery cause it has been unused for some time. Comes with 1 original Data Pacific Atari boot disk and 2 other disks. To boot in Mac 68k you need Mac boot disks. They are freely available on the Apple site. I think it uses v. 6.0.8

Message-ID: <_Wue6.13066$Q94.311200@monolith.news.easynet.net>
Source record: 50832

Hi There,

though I wanted to keep this machine I really need to clear some space again
and must therefore offer it on this group;

Boxed UK atari Falcon in excellent condition
14Mb RAM
800Mb IDE Hard Drive (original 64Mb Drive comes with the machine)
All original Disks and Manuals
Origianl Atari Video (19 Pin D Type on the Falcon) to VGA converter
1.44 Mb Floppy drive

I am open to offers, I would like to see a figure of £300 plus for this as
the machine is in such good condition and is sold as new, but please feel
free to make me an offer. Unfortunately it is unlikely that trades will
swing me as I really have a space problem.

Regards

Julian

1650. FS: Boxed Mega ST 2

Space causes an issue again, another machine to keep, now sadly to be sold.

Atari Mega 2
Keyboard & Mouse
Boxed with Manual

The front of the Mega 2 has yellowed a little otherwise in good condition.

Please make me an offer 50- 75 quid? I also have a megafile 30 with a US
power supply, that I might be talked into throwing in with this.

Regards

Julian

Hi Martin,

Yes, I've looked at Okami several times, but reluctantly put it down.
It's all that Unix jargon. It may well be the all singing, all dancing
answer to my prayers, but for the life of me I can't understand the
lyrics or the choreography. When I took Electronic Engineering way back
in 1960, we all used slide rules!! and we had one lecture on
transistors!! 'I can safely predict that nothing will ever come of these
things' (Lecturer). Programming and main frames were something we humble
graduates never came across. Unixese always strikes me as being a bit
like Latin as used (abused) by doctors, a useful means of keeping the
plebs at bay.

Paranoid Bob.

My choice is still 1stGuide, but as we've seen, it won't print text.
However, I have a faint memory of a different version of this software that
would. I can't find the archive ATM, but I'm going to take a look for it at
work later. I think that there was something about it which made me take it
off my hard drive though, so don't hold your breath!

I got it working after a couple of hours' work, so it can't be that hard ;-)

I'm told that the latest version has some of the config options brought out
into the program, which would help a lot.

This is off topic indeed and I won't give any comment on your
statements. I don't want to start a MiNT vs. MagiC war again.

>>>Emailer 2.3f works with MiNT as well...
>>
>>Wow that's what I call world breaking news. One Iconnect client that
>>works under MiNT. I'm impressed.
>Well, considering that you've claimed here that nothing works...
>CAB is also a client, so that makes two.

I don't see Cab as an Iconnect client as it works with the two Atari
TCP/IP standards STik/STing and MiNT-net. Hell it even works with the
good old NOS.

>>Tell me how performs the rest, Chatter, Teli, Fiffi under MiNT?

>They don't... and simply put, they shouldn't. If and when someone opts to
>use IConnect as stack, he also opts for MagiC. You may find this unlogical
>but I can reverse the question.. MiNTNet clients need their appropriate OS
>also in order to run, don't they?

Hmm, unlogical it is. Iconnect up to v1.7 works with MiNT so one
could assume that the clients will work also but to my knowledge with
the exception of one client they just doesn't work. AFAIK the MiNT-net
clients can be adapted to run with STik/Sting.

>Whatever you get with IConnect under MiNT is beside the point, give us the
>average figures you get using your favourite stack and clients. How long
>does it take to get a connection to your ISP, how many postings and mails
>can you retrieve in a minute, what's the average download speed from the
>chapelie ftp server? I'm bracing myself here for some amazingly fast

>numbers... "damned slow" must mean at least 25-30% lower then yours.

To put it clear. I was talking about Iconnect and MiNT. My experience with this combo is that it's compared to MiNT/MiNT-net damned slow. With MagiC it's maybe fast but certainly not on my system using MiNT. The original poster of this thread asked if Iconnect could be used with MiNT. I've given a fair answer "yes but..."

You know perfectly well that one can't make a comparation between two different machines on different places. The max. speed that one can achieve is higly depended of quite some things, especialy if one use a 56k modem. With such a modem one can get theoretical 56000 baud/sec (bps) but the speed that one really can get range from 42Kbps to 50 Kbps depending of factors such as:
-the physical distance between the modem
and the phone company. The greater the distance the slower the connection.
-The quality and type of connection between the user and ISP.
-Max speed allowed by the PTT. AFAIK for Belgium it's currently 54 Kbps.
-The traffic on the Net.
-Type of modem.

To illustrate this the following:
A few years ago I've installed a MiNT-net setup on a friends TT030. Although we were both using exactly the same setup with even the same modem and ISP his connection was 30% faster then mine.

I have said it already, the quality of my phone line is rather poor. Even if I take away the speed restriction I only can get a max. speed of 44Kbps but it's usually around the 42Kbps. But again due the bad phone line the speed sometimes drops down after some time to 37Kbps or even slower and in the worst case a disconnection.
So given that it's rather useless I give some figures. Making a speed comparation between News/Mails servers is also useless. The only thing that can give a indication of the speed is a ftp-session. For me using wget I get most of the time 4200-4400 cps (if the line stays good)

18:07:02 (4.44 KB/s) - `mint-guides.tar.gz' saved [187172/187172]

>
>> With MiNT-net Cab usualy doesn't go under the 4.000 cps.

>4000 ? that's pathetic....

Not with the bad line I've. 4.000 cps is an average speed. If I've the luck to have a good connection and if there aren't too many people on the Net I can go up to 6.000 and more but these moments are rather exceptional.

>>My phone line isn't good. In order to get a stable connection I must
>>tune down the modem speed to 42.000 bps. Even then downloading stuff
>>from the ftp-servers using wget for instance happens usualy with 4200
>>bps.

>Which still isn't good enough...

Indeed this isn't good enough but this has nothing to do with the used
TCP/IP stack. With MagiCHades/Iconnect I would have the same bad
results. I've the bad luck to have a bad line.

>
>Well if the Coldfire is like the 68000 series, then the 333mhz speed would

The ColdFire is a cut down version of the 68000 (few of the >='020
features are in there). Besides some mostly irrelevant stuff (like the BCD
instructions) they removed for example:

- All arithmetic operations on byte (8 bit) or word (16 bit) data.
This is used a _lot_ in Atari software, since the 68000 can often do
these operations twice as fast as the corresponding long (32 bit) ones.
(Code compiled by TurboC/PureC is very likely to have huge amounts of
16 bit operations, since an 'int' is a 16 bit word in those. Lattice C
and gcc can be told to do the same, but at least the compilers are able
to use 32 bit 'int'.)

- DBcc, a 'shorthand' instruction often used to speed up loops.

- The rotate (ROL/ROR/ROXL/ROXR) instructions. Perhaps not all that
common, but they tend to be used in the inner loops of graphics code.

The first one of these points will cause enormous speed penalities for
lots of 'legacy' code due to the necessary emulation. The new chip talked
about here has added byte/word compare and immediate move instructions,
but there are still none of the arithmetic instructions (and it's very
unlikely that Motorola will ever change the ColdFire architecture to
include them).
The second one may be just as bad, but compilers don't always use it.
The third can affect certain things a lot, but most programs won't be
affected directly.

Motorola claims ColdFire is a RISC architecture, which is at least
somewhat justifiable.

>be a much greater equivalent when you compare it to the Pentium. Like my
>Hades 68060 runs at 60mhz, but that is euivalent to a 200-400mhz Pentium
>depending on what you are running.

I keep hearing people claiming such things, but for (decent) programs
actually doing the same thing, that is just plain impossible.
If you want to try and prove me wrong, feel free to do so. ;-)
(I do own an AB040 board and 300/400/650 MHz PCs (K6-2/K6-3/Duron).)

All that tells us is that it doesn't have any artificial limitations.
The easiest way to make a graphics chip is to make the timing completely
software configurable. Then you don't have to worry about it at all in
the hardware. ;-)

>a faster logic speed core, and give it some nice clock of around
>64-100Mhz. should easily do big resolutions. This can be possible in

You should be able to do that easily in a rather cheap FPGA/CPLD.

Making such a thing VIDEL compatible in any useful sense would require
it to be on the same bus as the CPU, though, which is not a terribly
good idea.

>a Falcon, but the CPU is just too slow to process the huge amounts of
>data.

The bus couldn't handle it in any case.

Anyway, simply adding solid/pattern fill, mono-expand blitting, and
perhaps a hardware cursor to a graphics chip takes care of most
acceleration needs. For the rest, add a small programmable RISC.
Oh, wait! Isn't that a Galaxy? ;-)

1663. MagiCMac 6: Where to buy in North America

Newsgroup: comp.sys.atari.st
Date: 2001-02-02 16:25:44 UTC
From: Doug Kendall <kendald@oneonta.edu>
Message-ID: <3A7ADF88.C352DD6C@oneonta.edu>
Source record: 50844

Friends,

Are there any retailers who currently sell MagiCMac in the US or Canada? An email to Systems for Tomorrow (which I would normally consider the most likely source) hasn't yet elicited a reply; neither they nor Chromagic currently list it on their web pages. To be sure, the SFT webpage is in a state of reconstruction, so perhaps they've got it after all...

Has anyone on this side of the pond bought it from http://www.atari-workshop.co.uk , which was noted as a source in another MagiCMac thread here a few days ago? If so, what was your experience?

Thanks in advance for any ideas...

Doug Kendall

Hmm. Shouldn't a TT be able to depack a JPG faster than it can be
downloaded over a modem (not counting mapping to 256 colours (get a
graphics card))?
I guess the current software can't do it at the same time, but it might
be something for someone to consider.

>While I'm on the subject, how come there isn't a JPEG_OVL that takes

I doubt it. It would almost certainly be slower than not using the FPU.
On an '040 the FPU might possibly be a win, but I don't think so.

Why do you think it would be all that difficult or even a particularly
large project?
I mean, we already have MiNT and XaAES/oAESis, which are almost 100% C.
fVDI is a bit more assembly, but not all that much.
The only thing that's left is the XBIOS and that's pretty small.

>> Why must TOS (or MiNT, or MagiC...) be converted? It could very well run
>> under the same 68k emulator as the apps would do. Hardware drivers (or

Yes.

>> atleast part of them) would be x86, and this is enough to get it started.
>> Even if *everything* runs under the CPU-emulator it will still be faster
>> than anything we've seen before.
>>
>But it would be a hell of a lot faster if it was native code, tho. Beside's

Who needs a faster setscreen() or even malloc()?

The only parts of the Atari OS where you'd normally even notice a ten
times speedup is the VDI and the AES (and the latter probably not to any
major degree by itself).
GEMDOS, BIOS, XBIOS doesn't contain anything that spends any significant
time running on the processor.

>I would use my PC alot more if I could get rid of the crappy os's it uses.
>Win9x/NT sux, linux is great but a little inflexible, compared to TOS. Still

Linux inflexible compared to TOS? ;-)

>> Later, when the userbase grows and things starts to settle down, one could
>> gradually port the OS and apps to x86. Or even better, some sort of

There's a relatively active group of people working on the x86 AES/VDI.
They are nowhere near NVDI/N.AES/MagiC of course, but significant
improvements have been made over the original PC GEM.

>> meta-CPU like the new "Amiga" seems to be using. Then you wouldn't be

A strange notion if I ever heard one, but interesting in its way.

1666. Okami: Fun with Oexport.

Newsgroup: comp.sys.atari.st
Date: 2001-02-02 17:41:54 UTC
From: augeas@cableinet.co.uk
Message-ID: <3a7ad766132ae70@cableinet.co.uk>
Source record: 50847

I really like the latest beta version of Okami, and I'd
register to kill off the nagging were it not for one small problem: -I
can't send anything ! I've had no trouble with V1.34, which I've had
to use to send this. Is there any intrinisc reason why the latest
Oexport should have trouble with a Falcon and Magic 5. -I don't have
any luck with single TOS either. Here's the log file:

```
31 Jan 2001 17:57: Started `oexport -L 99'
31 Jan 2001 17:57: System: MagiC 5.3
31 Jan 2001 17:57: Cwd: I:\OKAMI.21
31 Jan 2001 17:57: Drive `I:\': max path length: 128, max name length: 12, truncation: 2,
case sensitive: 1
31 Jan 2001 17:57: News dir `i:\okami.21\news': max path length: 128, max name length: 12,
truncation: 2, case sensitive: 1
31 Jan 2001 17:57: exit code -1
```

Looks suspiciously like an error, if Okami isn't happy with
something it normally complains quite vocally, but Oexport just
terminates without doing anything. O.inf makes reference to
"charset.bin", which doesn't appear to be documented. I've selected
the default character set anyway. Could someone who has this working
tell me I'm not trying in vain ?

Help,
"Augeas"

>Yes, I've looked at Okami several times, but reluctantly put it down.
>It's all that Unix jargon.

It's clear to me that you haven't seen the latest beta. Allmost
everything can be configurated from inside Okami. You don't have to edit
the .inf file by yourself. Ofcourse if you want to pull Okami to its
limits you must edit some files yourself but for a commom user this
isn't necessary.

>graduates never came across. Unixese always strikes me as being a bit
>like Latin as used (abused) by doctors, a useful means of keeping the

I'm certainly not a Un*x-guru. I hardly understand the way Un*x (or in
my case MiNT) works but it pleased me. Some years ago I was really
afraid to use command line interpreters now I love then. It give me the
felling I'm controlling the machine and not the other way around.

Not necessarily- depending on what the "emulator" actually does. I think
that he meant to use command.com just to load the "emulator" which could
then overtake all OS functions.

But even if command.com remains partailly functional one might think
of it as some sort of addition to BIOS, to be used by the new-loaded OS.

Are there some real examples available, like- an application XXX takes N1
seconds to do something on a Milan and N2 seconds on a ***MHz PC with
emulator YYY- preferrably without Windows. (Ok, I know that floting point
performance is an especially weak point of emulators, so it should be
some fair comparison). And what about compatibility? Apps that do/do not
run on clones vs. emulator(s)?

>The main problem is that (most) do not support things like high resolutions,
>etc as they are just ST emulators and not Flacon or TT emulators. I think
>TOS BOX would probably be the best at present.

I found TOSBOX very good, compatible and simple to use, and OK for high
resolution, (used 1024x768 monochrome). It had just a few quirks which
I thought were easily correctable. I tried e-mailing the author on this
subject, but got no response.

I suppose that some chimera between PaCifiST and TOSBox would be almost
ideal :) STonX/DOS also seemed promissing- though I could not get it to
show higher resolutions (the docs said they were available), and
it didn't handle serial and parallel ports.

Btw. I tried GEMBench on TOSBox (on 440MHz PII Compaq)- even if they say
GEMBench is not very good it shows -something- and it declared approximately
5x TT speed, except for floating point which was about 1/5 TT speed.

Hmm, not quite sure but it looks like you haven't set up Okami
properly. You really must read the okami.htm file. There are lots of
things that has been changed.

Do you have an info dir?

root@hades060/d/okami-online/info>ls -lR
.:
total 176
-rw-rw---- 1 root wheel 385 Dec 30 10:55 alias
-rw-rw---- 1 root wheel 49519 Oct 18 1999 charset.inf
-rw-rw---- 1 root wheel 2447 Nov 10 09:01 folds.inf
-rw-rw---- 1 root wheel 1379 Sep 19 1999 groups.inf
-rw-rw---- 1 root wheel 8778 Aug 18 13:17 keymap.inf
-rw-rw---- 1 root wheel 64 Jul 31 2000 language.inf
-rw-rw---- 1 root wheel 6628 Jan 29 1985 oaddr.inf
-rw-rw---- 1 root wheel 3066 May 23 2000 oexpire.inf
-rw-rw---- 1 root wheel 56 Nov 19 1998 register.inf
-rw-rw---- 1 root wheel 2092 Oct 30 14:49 tos4ever.mfi
-rw-rw---- 1 root wheel 978 Oct 13 16:10 tos4ever.qfm
-rw-rw---- 1 root wheel 3513 Nov 5 17:30 tos4ever.sig

It must hold the above files
If I for instance remove the alias file I get this when I run oxeport:

02 Feb 2001 20:05: Started `oexport -L 99'
02 Feb 2001 20:05: System: MiNT 1.15
02 Feb 2001 20:05: Cwd: D:\okami-online
02 Feb 2001 20:05: Drive `D:\': max path length: 259, max name length: 255, truncation: 0, case sensitive: 2
02 Feb 2001 20:05: News dir `d:\okami-freegates\spool\articles': max path length: 259, max name length: 255, truncation: 0, case sensitive: 2
02 Feb 2001 20:05: exit code -1

Pretty much the same error like yours.

Hi Martin,

I'm always willing to learn. Show me the way to the latest Okami please. Are you sure it works under plain Sting. As I remember it said it only worked with some protocols. Do these include or are they included in Sting/Stik?

Bob.

Hi Lyndon

>My news server seems to have changed all the Xref numbers so all the NG
>start at 500 or so :(

I Also found that, i origonaly hard coded the IP no's in coz the
nameservers kept chucking me off, when my system failed and i realised
what was happening i re-inserted the server names and they came back with
different No's, the NNTP server was a wildly different number. I then had
to delete all my .IDX files and download NG's from scratch.

This fish is turning out to be a bit of a DOG(fish)

>Also there seems no provision for subscribing and unsubscribing from
>NGs. What am I missing.

Bob,

I was baffled by this for a while. Try putting this at then
end of the AMAIL.CFG file.

```
CustomBoxName = comp.sys.atari.st
CustomBoxPath = e:\internet\amail\news\csast\csast.box
CustomBoxType = 2
NNTPMsgs = 300
CustomBoxName = comp.sys.atari.st.tech
CustomBoxPath = e:\internet\amail\news\csastech\csastech.box
CustomBoxType = 2
NNTPMsgs = 300
```

Type 2 boxes are for newsgroups. Create the folders in the appropriate
places and run amail. I don't think that the .box file is needed but
if it complains then just create an empty file.

I only used amail for a short while. It has some really nice features.
If amail and MyMail combined forces it would be a really excellent
package ;-)

I can't believe this as the programmer afaik use Magic.

I believe that A-Z has problems with huge files. At least on my Hades060
A-Z dies with an ILLEGAL INSTRUCTION when it try to convert a 800Kb file.

http://www.xs4all.nl/~josdb/okami.html. Download the latest beta.
Read carefully the include okami.htm.
Okami is a offliner so it works with all setups except Geneva. With
Geneva there are a few small problems but it seems to work more or the
less. To get the most out of it you need a multitasking system. Both
MiNT and Magic are good.

To retrieve mails/news you need two other programs:
Popwatch -->Mails
Newswatch -->Usenet

Both can be found on the Belgian ftp-server

ftp://chapelie.rma.ac.be/atari/internet/popw291.zip (71.690 bytes)
ftp://chapelie.rma.ac.be/atari/internet/nwtch250.zip (49.516 bytes)

These programs will work with STing/STik/Gluestik/

Unless someone is prepared to spend a _lot_ of extra time on it, you're
going to have to chose between DOS-free and those peripherals (assuming
it is even possible to get hold of the necessary documenation).

>want to develop any further, so some enthusiast may work on. Only STonX
>source is currently available AFAIK.

Well, one should be enough, but STonX, being 100% C, isn't one of the
fastest. It should run on just about anything, though.

>On the other hand, maybe it would be good to keep just the barest core
>of DOS hidden somewhere within the emulator, just for the sake of device
>drivers- so the existing DOS drivers for a multitude of devices maybe might

Yes.

>Out of curiosity, has somebody compared the real speed and Atari-
>compatibility of a clone like, say, Milan (or even a TT with a graphic card)
>vs. a fast PC with a PaCifiST, STonX or TOSBox? Is the compatibility of a

Below are the results of a little speed comparison I just ran, using
MGIFv5.10 on a 1024x768 greyscale image (DSP code disabled and all the
algorithms use gcc-compiled C code).
Timings were done with a wristwatch and are accurate to within 0.5s or so.

caches on (incl cb) GEMulator2000 (free version)
Falcon+AB040 PC, 650 Mhz AMD Duron
5x5 convolution 19 6.5
bump map generation 11 4
'oil paint' effect 26 9
30x30 blur 26 7

(The FPU test in GEMBench puts GEMulator at 14 times the speed of an
FPU-less Falcon (this is really an integer test for machines without FPU
(which includes all the emulators, AFAIK)).)

Note that this is a CPU (real or emulated) only test. No graphics output
is included (except that a progress bar is updated periodically).

So, my PC is apparently around 3 times faster than my Falcon+AB040 when
running under emulation (in the case of Gemulator2000).
That should mean that it's relatively similar to the fastest Atari clones
currently available. And this is a pretty low end new PC (if you can even
find a Duron/650 these days it's well under $100).

>current "emulator" really much worse than that of a current "clone"? Which

Some of the emulators are a lot more ST-compatible than a Falcon, not to
mention the clones. Obviously, there's nothing limiting the level of
compatibility on a machine implemented as software, though you pay a
price in terms of lower performance for more hardware compatibility.
This compatibility most likely doesn't extend to hardware like serial and
parallel ports or MIDI, though.

>crucial applications do not run on emulators and run on clones (ok, I know
>that emulators are currently 68000-only, but that's not a fundamental
>limitation)?

Unless there's a bug in the emulator, it should be at least as compatible
as any clone could ever be. Since noone should be accessing the hardware
directly these days (with graphics cards and clones 'common'), the job
for the emulator gets easier.

Unfortunately, as others have mentioned, the emulators don't generally
support any decent graphics modes. There is no reason why they shouldn't,
though, since it's simple enough to write an appropriate fVDI device
driver if the emulator only provides access to an area of memory that
will be displayed directly. If parts of that device driver is implemented
natively, it could be _very_ fast (there would be nothing stopping it
from using the accelerated X, Windows GDI, DirectX, or whatever).
There is a 100% C (apart from some common driver 'glue' code) 16 bit
example driver available for fVDI which could be used as is, or as a
starting point.

I'm with you now. Unfortunately, wrt the graphics card version, it's
you that's confusing the INF files. Aside from C:\NVDI.INF it's
essential to have NVDIVGA.INF in the AUTO folder, created by
VMG4000.PRG, which holds details of manually created screen
resolutions, dot-clocks, horizontal and vertical screen offsets and
multitude else. We're talking at cross-purposes here, Peter.

It did sound that way, but I was more showing a concern for the
capability of fVDI to track the capability of NVDI rather than the
hardware itself. This was certainly more of an issue before MVDI docs
were available in English than they maybe now.

As long as the fVDI software is still being developed and if they can
respond to user-concerns then it becomes viable, yes. I'd certainly
like to know that graphics cards continue to be possible with a TT -
for a whole while it seemed like the lack of harwdare was going to be
a real drawback from getting best use out of the machine.

t's certainly true, though, that NVDI for graphics cards are a long
way from reliable IMO.

It seems that both you and I are the only people in the world who have this problem. But first, do you have DRVIN & SCC.PRG from the HSModem package set up in your Auto folder? I do, but Serial.cpx still starts up showing Modem 1. All other comms programs work fine.

In addition, Modem 2 supports wierd port baud rates of 19k2, 38k4, 76k8, 153k6 and 230k4. You may want to use serial 2 (with the appropriate changes to SCC.PRG and STinG to match) to get the more standard 57k6 and 115k2 rates.

I've resorted to setting the CPX every time I boot up...

1692. [WEB] Aniplayer 2001 V2.14a

Newsgroup: comp.sys.atari.st
Date: 2001-02-03 11:12:10 UTC
From: didier.mequignon@REMOVE.wanadoo.fr
Message-ID: <95gp2aksg2@wanadoo.fr>
Source record: 50877

Hi,

There are a little release on my site (V2.14a):

- Polish translation for V2.14.
- Fixed bug with AV_SENDKEY message (thanks to Claude Labelle,
the author of CD-Writer).
- MP3 DSP more fast (with DMA transfers):
The average DSP load is 64% for an MP3 44,1 KHz joint-stereo file
and a DSP at 50MHz, so it's just the limit for listen this files
in stereo with a DSP at 32 MHz (a CT60 for example if you not put
another oscillator for the DSP).
- The 'Quality' option now is used with MP3:
* With the CPU, when this option is checked the quality is better,
but decompression is more slow (some %).
* With the DSP, when this option is checked the quality is equal
to V2.13 (more slow), and when this option is unckecked the quality
is better than V2.14 (more fast) and lower than V2.13.

Regards,

Didier.

To be used with Geneva you have to do some minor hacking inside the Okami
binaries as Jos den Becker has put in a check for Geneva to prevent this
combination. At least with beta 18 it does work very nicely as long as
you see to that Okami _never_ launches any TTP program from within O.PRG.

Imho it would have been better if he had permitted its use under Geneva
but prevented all TTP launches instead.

Whith CAB on one TT and the Weblight webserver on another (with only ST
RAM) I get around 6500 bits/sec in CAB on Modem 2 running at 76800bps.
Note both TT's runs Geneva and STinG.

When browsing the Weblight server on my pc connected with Ethernet I get
around 26000-30000 bits/sec in MSIE 5.0 and I suppose The Geneva+Weblight
combination is what slow things down.

So here STinG is by no means slow at all.

Ok, I've tried switching the the "LAN" port in the STing CPX's and it says it fails everytime. Why would it fail? I saw Dan Ackerman say something about if you have a video card that they may be disabled???? I don't have one, but I seem to remember the guy who sold this TT to me saying something about he used to have a video card in it,

Also, I've been searching the net high and low for the latest HSMODEM release...? Can't find it... any help?

GENERAL MAILING to all ATARIANS

Hello,

- I have now good sources (in USA) for 060 ! See the new and good CT60 'Prices' ...

- See the new '060 vesus Coldfire V4e' area. It will nextly be completed by a technical explanation...

- The 'Overview' was updated with 2 new tables for CPU and RAM performances! Very interesting to see that some old previous machines have (very) low performances !
Still to be completed : if you have a computer for which the values are missing in the table, launch NEMBENCH 2.1 (not the 1.0 !) and give me your results for LINEAR FAST-RAM 32-Bit READ and WRITE...Thanks

- The logic design of the SDR60 (SDRAM controller) is nearly finished !

- 49 personns answered they want to buy the EC version of the 060 (don't need the FULL version) : so, the CT60 will have a boot compatible with the 2 versions of 060 !

Bye

Hi Chris,

>The blame lies fairly and squarely with Artworx if it is producing
>incorrect files,
This is strange reasoning... just because Papyrus isn't able to handle the coloured GEM format correctly that is generated by a number of applications Artworx is to blame?

>the other programs you mentioned are a bit lax in interpreting what
>they're supposed to be.
So Calamus, Photoline, TMS vector, Cranach studio... etc interprete the standard loosely? I've created a coloured GEM file with all of the above mentioned programs, they all accept the file(s), the only odd one out is Papyrus which screws up the picture everytime, no matter what program it was created with.

>I reckon the makers of Artworx should be persuaded to correct the fault
>first, or if they could provide a utility to convert incorrect files.
Not at all... since Papyrus is the program that has a problem, ROM should correct it. Following your reasoning nearly all apps that create coloured GEM files should provide such an utility... since it's not just with GEM files from Artworx that Papyrus has a problem. Why should the people behind Calamus, Artworx, Photoline...etc bother correcting ROM's sloppy efforts?

>I have a similar problem with Papyrus and fVDI actually. A certain
>fault, only when fVDI is running, causes Papyrus Office to crash when
>trying to run a report. I have to disable fVDI and run Papyrus in low

>>No, what I would like to see are applications that are written
>>exclusively with the 68040/68060 in mind.

>I don't really see the point of this. Surely equivalent applications
>will exist on the Intel/Mac platforms?
I've never heard any complaint about Falcon specific apps here. What I
have in mind is the same thing, some software that exploits the hardware
of the Milan/Hades.
That these apps exist on the PC/Mac platform shouldn't be an excuse not
to develop them, this thread is not about switching platforms...

>If the new 'clone' or 'emulator' does not run most of them, it is of no
>interest to me. I suspect the same goes for most other Atari users.
I've been singing a song like this for weeks here !!

>Sure, a few are interested in screwing the most they can out of their
>machines with hardware upgrades (I have a Nemesis in my Falcon) and a
>few others seem to think that a 'real' Atari (whatever that is
>nowadays!) is a must, but most would be content with a compatible
>machine that has a better browser that understands Javascript.
Exactly, now just suppose that someone writes that browser but that it
would need the power of a 68060? it *might* be an incentive for people to
upgrade, upgrading doesn't mean loosing compatibility, the Milan/Hades
are both very good in that domain, which remain to be seen for the
proposed Pegasus... or whatever else might appear in the coming months.

>But, I repeat, it MUST be compatible with the majority of
>well-written software.
I've been singing that song for weeks as well...
The majority of us is getting on a bit... perhaps a hearing aid is more
urgent then a new clone?

Cheers from Belgium

You've seem to forgotten all about the XTOS Poll.
Since the developers decided to go for the Coldfire design, I can only
assume that this was what the majority of the people wanted, after all,
it was claimed that they would build a machine with specifications that
would closely resemble the poll results...

: >>
: >>
: Thank you kind sir. So there is no way to replace the single-sided drive
: with a DS-DD? That would be totally useless if there wasn't...

Depends entirely on time and ambition.I ran out of ambition. The same
cheap connetor was used on the external disk drives, and I got far into
the project of making a HD external drive fit in one of them to figure out
that all the needed wires are there, but a patch cable or something like
it was required.

The hard part is mechanical, since there are places for all the necessary
electrons

> > things in order.
>It did sound that way, but I was more showing a concern for the
>capability of fVDI to track the capability of NVDI rather than the

As was mentioned earlier, fVDI doesn't necessarily have to track NVDI,
since it can work together with it. NVDI on top of fVDI is no different
from NVDI on top of the NOVA VDI.

That said, my intention is certainly to implement most of the new NVDI
functionality in fVDI.

>hardware itself. This was certainly more of an issue before MVDI docs
>were available in English than they maybe now.

I can read German without too much trouble, anyway. ;-)

>As long as the fVDI software is still being developed and if they can

It's GPLed, so that's not nearly as major a concern as with for example
NVDI.
(If anyone is interested in helping out in some way, please let me know.)

>respond to user-concerns then it becomes viable, yes. I'd certainly

'they'? I'm usually only one person. ;-)
I guess in this context you're talking about Mario too, though, and I
obviously can't speak for him. We're not even working together on this,
except that I've been helping him out a bit with the fVDI device driver
(as well as improving the example driver the Galaxy one is based on).

I don't know if the Galaxy fVDI device driver will be GPLed (the example
one isn't, to enable it to be used as a base for commercial drivers).

>t's certainly true, though, that NVDI for graphics cards are a long
>way from reliable IMO.

What reliability problems have you seen?

From: Clement.Benrabah@wanadoo.fr
Message-ID: <95ho8m$282$1@wanadoo.fr>
Source record: 50748

Hi,

I'm trying to use the Milan 1.15.5 Mint's kernel and i don't succeed in.
My Milan doesn't go on booting after the reading of the mint.cnf.

I removed the programs that might make troubles and i've only kept
the drivers without success.
The mintnp.prg (special Milan version) is the last program in the AUTO folder.

Neither Naes 1.2, nor a shell are being launched after the reading
of mint.cnf and my Milan always stops at this moment.

I'm still using the 1.15.1 kernel.

Could someone help me ?

Clement

Hi Clement

This is probably a problem with you using an old FNRAMFS. You MUST
use version 0.70 or better. I made the same mistake the first time I
tried it.

1717. Re: News Groups with Amail

Newsgroup: comp.sys.atari.st
Date: 2001-02-03 21:41:45 UTC
From: peter.slegg@===ANTI-SPAM===scubadivers.co.uk
Message-ID: <3a7c7b19.0@energise.enta.net>
Source record: 50750

I've just been having another look at A-Mail again and I remembered
why I switched back to MyMail.

Firstly, the pop-up address list only displays the top part of my
address book.

Second, I couldn't figure out how to send a message to a News group
so I reverted to Newsie.

On the subject of address books for e-mail programs, I noticed that
it is an area that most of the developers leave under-developed.

Even the one(s) in M$ Outlook are poor and they have an infinite
number of programmers to chuck at the development.

Can I make a suggestion...?

Why don't the developers of these mail programs all get together
and come up with a standard for a single Address Book program
which they all use ?

It would have a standard api which could be published and between
them they could develop a shared Address Book application.

Okay it needs a bit of co-ordination and agreement on coding
language and standards but wouldn't it be useful to have
one Address Book for everything.

It could hold e-mail addresses, phone numbers, actual addresses
(making this International may be a bit tricky), company names,
distribution list, groupings etc.

What do the developers think ?

regards,

Peter

Hi Bob,

>Your advice is the same as another of the DDP gang, Dennis, great minds
>think alike!!!.
Flattering doesn't cut wood here ;-)

>I have installed QED as both the Editor and Viewer in Jinnee and it works.
Hohoho... I've only advised you to assign QED as editor in Jinnee, when in Emailer the option "Show source text" is selected, Jinnee calls up QED that displays the mailing... using QED you can then print the mail or a selected part.
As viewer QED is not really suited, I normally use ST Guide here, since pic and sound formats are assigned to Imagecopy and Aniplayer this combination is just great. Printing and copying to the clipboard from within STGuide is also possible.

Cheers from Belgium
Dennis

From: cstanley@zetnet.co.uk
Message-ID: <3a7c8db5$0$175@news.zetnet.co.uk>
Source record: 50756

I had awesome troubles installing STiK2b --- no, don't ask :)

At length I've got it going beautifully (at the moment: forgive me, Dan,
well, I'm suspicious of things that work but just may not ...).

Over all, I will stick with STiK2 rather than STinG: thanks, Dan, indeed.

Regards, all,
Charles.

TT030; AmgiC 6.01; Newsie 0.961; CAB 2.7; Hades 060 (not on the Net; and,
incidentally, unable to boot to the Rage card: I live in hopes);
Papyrus (awaiting my registered version: Oy, Ulli?); Protext (so far
my favourite and regularly used dtp app, but with disappearing suppliers
of upgrades already paid for); Aniplayer 2.14 (just glorious); ExtenDOS
Gold (which currently smashes my boot-up to smithereens)......

I will not repeat this trailing notice again, I promise :)

I think you're right, Dennis. The presently existing clones, and the upgrades to existing models, are surely enough to satisfy the desires of most Atarians. I have a TT030 with, I think, 12 MB memory (more than my personal memory) and a Hades060 with 6 MB; these more than satisfy my desires. (My memory is very imperfect)

Cheers,
Charles.

You're talking about the freeware emulators... Magic-PC has no problems with
high resolutions... anything that the graphic card can handle, MagiC-PC will
handle as well.

If you want to see "fast" emulation then the PC is not the way to follow, a
MAC PPC running MagiC-Mac is the ultimate in speed and compatibility... add
NVDI, Jinnee and Scripter to this combination and even die-hard Mac users will
be amazed...

Cheers from Belgium
Dennis

The IConnect OVL from ASH loads the page without any problems but... since
the contents are witten in HTML 4.0 and contain some Java applets CAB doesn't
display it all. One can only look at the source code.
Incidentally, the latest update of Draconis Pro just bombs when tyring to
access that page...

>As I warned to people this doesn't work with my released OVL. I have one
>in testing that fixes this problem though.
There's no point... even if your OVL manages to load the page, CAB just can't
handle it.

They are the official English distributors so you can't go wrong...
However, they don't sell the latest version of MagicMac meaning that you
might get into some problems when running OS9 or using one of the latest
iMacs.
The latest version of MagicMac (6.10.4) is available from ASH but will be
a German version...

I have runned Diamond Edge (v1.10 and v2.04) with up to 500MB partitions
without problems on STfm, TT and Falcon.

I tested for a moment ago on a 700MB partition and Edge v2.04 was not
happy... it was complaining over corrupted directorys and lost clusters (I was
coping the files to the empty partition for a few minuts ago and then
moving/copy between directorys). That can be Edge fault, i dont know.. I
useally dont run Edge on partitions bigger then 500MB

Never use Diamond Edge on VFAT, FAT32 or MinixFS/EXT2-partitions and
make backup to be safe.

... and one more thing, run Edge in Tos.

Hi Odd,

>Well, I don't know much about the project at all, all I know is that if a
>ColdFire 4e machine really makes it, I'll get one. If a machine wihtout
>pmmu appeared it would NOT get one. Mind you, pmmu is not important to
>anything but MiNT, as no other OS's use it.
Although I'm not a MiNT-fan <grin>, I wouldn't get one either. Disregarding
if someone uses MiNT or not, a machine that's not capable of running this
OS doesn't deserve the label "Atari clone". Including TOS there are three
widely used OS's on this platform, I expect a clone to run at least all
three...

>>in fact it's the *big* MiNT argument, one can port all these nice
>>apps to it... well, where are they?
>
>In fact, we can already now use Netscape (along with other x-apps)
>remotely on MiNT becaues of xgem.
Yep... I've just read Jo Even posting on the subject. It's my impression
that one can make it run, but between running and actually being able to use
it there's a subtle difference.

>For nice mint apps, try sparemint.atari.org
Last time I looked there, I wasn't very impressed...

>>at the moment there's not *one* application out there that can even
>>persuade me to switch. I would say the opposite is true...
>
> Keep your eyes open in the future then :)
Someone following this thread might think differently, but in general I
have an open mind...
If anything appears that is "usable" (not simply run), and unlike most of
the existing stuff is geared towards networking or internet clients, I'll
give it a try... :-)

>>As for the Pegasus: a TOS compatible clone should be able to run MiNT
>>*and* MagiC, if none or just only one of them would run on it, I
>>certainly wouldn't buy it.
>
>Well, some Falcons can't even run MagiC right. And Falcon's are not
>considered a clone, now is it?
On average once every three months this argument pops up here...
It's probably pure coincidence and sheer luck, but I haven't seen a Falcon
yet on which I couldn't install a stable running MagiC....

>> You still don't think that's bullshit?
>
>That would have been bullshit, yes. But luckily they've seem to have
>decided to wait for the 4e...
That's todays excuse... I wonder what the next excuse will be like.

Cheers from Belgium
Dennis

On 3 Feb 2001 17:51:38 +, Dennis Vermeire wrote:
>This is strange reasoning... just because Papyrus isn't able to handle the
>coloured GEM format correctly that is generated by a number of applications
>Artworx is to blame?

It depends if 'coloured GEM formats' were specified in the original
GEM implementation. If they were, then Papyrus is at fault. If they
weren't, then it's a developing standard. You can lobby for inclusion
of support in Papyrus, but it's a bit unfair to do an out-and-out
criticism.

I have to admit ignorance as to what the GEM standards specify.

>So Calamus, Photoline, TMS vector, Cranach studio... etc interprete the
>standard loosely? I've created a coloured GEM file with all of the above
>mentioned programs, they all accept the file(s), the only odd one out is
>Papyrus which screws up the picture everytime, no matter what program it
>was created with.

Suppose for one moment that these file formats are non-standard files,
according to GEM specifications. Yes, in an ideal world, every
program would be able to read every other program's file formats. But
as mentioned above, go ahead and request the support, but I thought
the original criticism of Papyrus was a little over-the-top. You
ought to be taking the attitude of "coloured GEM files are a
developing standard and it would be helpful if Papyrus could read
them" rather than "Papyrus is hopeless because it can't read
non-standard files created by other programs".

Yes, that's the point. If the unpacking could commence at the same time the download was coming through there'd be no problem - although dithering to the screen res would also be an issue, I'm sure. Running in 65k colours is a plus, of course <g>

So, the transfer to/from the FPU is greater than the DSP? They wouldn't run concurrent with the main processor? If that's right, what a bummer... B^<

Is it possible you've still got the VME port backplate? Could it be in
the box for the graphics card (that's where I kept mine for a while)?

> What I want to achieve is a fast connection via serial to another
> computer AND (maybe without swapping ports) a 33.6 or 56.6 modem

For the Modem 1 port you use MFP and for the Modem 2 port you use SCC.

> When I use the Connect program none of the settings come close to
> any other standards under Terminal, is this because I was using the
> MFP version or what?

The fastest standard rate for modem 2 is 38k4 bps. It's unlikely the
modem itself will understand 76k8 or 153k6 (if anyone knows a model
```

that will, please tell me).

> What settings should I use for the SCC program (there are a number
> and the English instructions did not really help)?

This is what I use - based on my most recent fumblings. Some settings may not make sense, but they work, assuming you don't have the RSVE mod and you run Magic...

```
DRVIN:
FASTINT N
EXOPEN N

MFP:
RSVE N
REPL u (6 times)
DTR Y
RBL 16384
TBL 8192

MFP_TT:
RSVE N
REPL u (6 times)
RBL 16384
TBL 8192

SCC:
M2TT u
M1EMU 1
LANBIT Y
LANEXT N
LAN_S2 u
DTRM2 Y
DTRS2 Y
M2DRI N
S2DRI N
RBLM2 16384
TBLM2 8192
RBLS2 256
TBLS2 256
```

Note that the M1EMU setting I use makes MFP redundant (I think) because I don't want to use the Modem 1 port. Your purposes may require this to be changed.

I was a dealer back then and collected atari ads, but if I recall correctly, those last commandments were never published. It would take an insider to know if there were more that never made it to press. I've moved recently, so I can't find the folio that has those ads in it, but I'll get back if I find them.

That's odd, it does run under N_AES rather smootly.

I only have check it out offline but of the three browsers I have Cab performs the worst. Both Adamas (latest release) and Wensuite displays the index page much better then Cab. Ofcourse I'm not sure as I haven't seen that page in its full glory (I don't have a pc nore Mac so...) but I think that the lay-out I see in Wensuite is very near the real lay-out.

Almost forgot for Cab and Wensuite I was oblied to delete those blank lines in the original index.html before they were able to display it as a html file. Adamas seems not to have trouble with these lines.

The maximum partition size for TOS 1.04 is 256 MByte. Anything else is
definitely wrong. This also applies to the size of the boot partition,
which is not restricted to be smaller than other partitions.

Very interesting... and somewhat nostalgic..! :)

The comments in the readme file do indeed make it look like the incorporation of the IC chip is simply a ruse to fool everyone into thinking this is anything more than a commercially packaged "BlitzTurbo" disk copier.

I built the Blitz years and years (and years and years) ago, and it actually WAS for another legitimate use.

I was the Disk Librarian for the local Atari user group (M.A.C.E., the Michigan Atari Computer Enthusiasts, arguably the largest Atari user group in the USA at one time... but I digress...).

While the original reason for the Blitz Turbo was indeed simply to copy copyprotected disks, it has another very useful feature- it is FAST!... VERY fast!

In addition, you don't even need to format the destination disks before copying them. The process of copying the original disk also copies the disk format at the same time.

Stick in the original, stick in a blank, hit "Go!" and as fast as you can count to 80, click, click, click, the drive copies all 80 tracks.

A disk librarian's dream.

Well... until reality reared its ugly head.

The way the Blitz Turbo works is to take the output of the source drive and connect it to the input of the destination drive.
You DO NOT connect the drives to the normal floppy disk jacks on the ST, you connect the drives to EACH OTHER.

Then there's the DB25 plug that fits into the printer port which the Blitz Turbo program uses to control the drives.

(It's sort of a "Y-cable" arrangement. I took a normal floppy drive cable and cut it in half. Then I soldered the input lines to the output lines, using the DB25 plug as the terminals to hold the wires. Thus the DB25 was at the base of the "Y" and each floppy drive at the ends of the cable. That's all there is to it.)

The Blitz Turbo program starts the drives, then reads the sync pulses from both. When both drives are turning at the same speed, it steps the heads in from track 1 to track 80. (Come to think of it, it must have done it twice, one for each side of the disk.)

This way, EVERYTHING is copied EXACTLY the way it is on the original disk. "Phantom sectors", "weak sectors", "invalid sector headers", you name it, whatever the copy protection scheme was, it just copied the bits from one disk to the other. When you were done, you had an "exact" copy of the original. Closest thing you could get to running a disk through a Xerox machine and making an exact copy.

Well, almost.

The problem was, there was no error checking. No checksums, no disk verify. No nothing. (Of course, that was kind of the point. You WANTED to copy errors- but only the "good" errors, not the ones you introduced by playing Rube Goldberg with disk drives). *

If your destination disk had a bad sector, whatever was on the corresponding sector of the original disk got copied onto it. Blammo- your destination disk would blow up when you tried to read that sector.

If the speeds didn't sync up exactly right, you might get part of the disk right and the rest would be Chinese (no offense to the Chinese in the audience).

It was sort of like trying to copy a music CD by holding a microphone up to the speakers while taping it on a battery operated tape recorder.

If all you were trying to do was pirate CHAOS Strikes Back, maybe that was an acceptable risk, but you REALLY don't want to face a bunch of angry computer club members who had bought disks at the last monthly meeting and couldn't read them on their drives when they got home..!

The only way to avoid being impeached, lynched and crucified by a gang of screaming Atarians was to check EACH disk individually as it came off the copy machine.

Which took longer than just doing it the old way in the first place.

The Blitz Turbo cable was retired, and went into the big bit bucket of "nice idea, but..."

However, it DID work, and it WAS fast.

To make a long story, well, not a whole lot longer, the Blitz Turbo, or the Synchro thingie would be the ideal answer to Steve's original question.

It would eliminate the need for messing with things like MSA, and just make an "archival copy" of his "key disk".

If anyone knows where a copy of the Blitz Turbo doc file is, it had pretty good instructions on how to make the cable, along with the program needed to run it. The Synchro program might work too, since it really looks like a re-hash of the same thing.

Hi all,

> It depends if 'coloured GEM formats' were specified in the original
> GEM implementation.

According to Ulli Ramps, the GEM format *was* specified. The problem is with import of colour values. He quotes a number of programs which 'obey' this standard. It seems that all the other programs mentioned here adhere to another 'standard'. GemGraph produces metafiles which import correctly into Papyrus but Kandinsky and ArtWorx reject these files. So there is an obvious divide here.

Rom-Logicware said they are going to try to contact the ArtWorx author to see about implementin an import for CWG files in Papyrus. In the mean time, ASH provided me with the "raster print module" which outputs ArtWorx documents to TIF files. Hardly ideal, but gets me through for the moment

> I have to admit ignorance as to what the GEM standards specify.

Me too! =)

Hi Dennis,

I chose Qed as viewer/printer as a quick fix. It worked, but now I will change
to ST Guide as advised. I'm experimenting with Popwatch/Newswatch/Okami, so
have a lot of head scratching (for my case substitute, bald pate) ahead.

Bob

And for the British in the Audience, Heath Robinshon.

Richard, who knows about Rube Goldberg and Heath Robinson, but has made
a point of eliminating all traces of MacGuyver from my mind.

I am aware hat it would be a considerable effort :(concerning
accessing the peripherals- it's supposed to be done through PC's BIOS,
isn't it? On the emulated-side interface, I understand there is a precedent
in the form of new BIOS functions created for the Milan (PCI, etc).

>Well, one should be enough, but STonX, being 100% C, isn't one of the
>fastest. It should run on just about anything, though.

I have tried several emulators on the same PC- and found that, although
there are differences in their speeds relative to one another, they are
not significant.

Btw. do you have any opinion on TOSBox (needs only a minimum DOS, handles
well high resolution, and behaves OK with NVDI, Mint, multitasking, etc) ?

>(The FPU test in GEMBench puts GEMulator at 14 times the speed of an
> FPU-less Falcon (this is really an integer test for machines without FPU
> (which includes all the emulators, AFAIK)).)

I don't quite understand this. Do you mean to say that all floating-point
operations reduce to integer ones? So a pair of integer/floating tests
would always give the same speed ratio regardless of the machine.
But that makes floating point ops no less real on a higher level.

>So, my PC is apparently around 3 times faster than my Falcon+AB040 when

>Some of the emulators are a lot more ST-compatible than a Falcon, not to
>mention the clones.

I thought it would be something like that.

So it seems that a "software-only" solution (i.e. a good emulator on a PC
confugured for high speed) can bear with any currently available clone-
and be much simpler to implement. I would like to see a new PPC-based
Atari clone, but I am afraid that a project like that would be an economical
disaster and therefore not likely to succeed. So using Intel-cpu
boards seems to be the only reasonable alternative. If it can be argued

that "OS-is-a-platform" there is no particular reasons (except religious)
why not to (if one is worried about the "impersonality" of PCs, perhaps
some little known brand with extravagant outer styling can be selected,
and a goal be set to achive the best performance and compatibility with
that particular make).

1751. Does anyone have an external hard drive for a Mega 4 ST or know what it's called?

Hi Dennis

>Load the list in QED, go to menu-item Edit, click on "Select all", next
>select the entry "Sort..." (works for me).

I did this, it worked perfectly, but today when i grabbed my mail today,
eMailer insisted in recreating my groups in duplicate, and then refused
to kill one reporting a GEMDOS error. It seems eM must be using the
positon in the grplist file as an index and my shoving them around barfed
this up!!.

Elliott,

That would be Atari's MegaFile Hard Drive. It was typically marketed in 20mb, 30mb and 60mb sizes. It used the old, and slow, 5.25" hard drives (MFM, etc.). Your best bet would be to try to find a SCSI interface, such as the ICD Link or Link2 and simply connect a standard external SCSI hard drive to your system.

If you really do want one of Atari's Megafile drives to stack with your Mega4, I do have an old Megafile system lying around with a bad drive mechanism ---- everything else is fine, if you can find a replacement drive mechanism to go in the system. Email back if you should want to go that route and we'll work out a price and shipping details, but as I said before, you'd really be better off with a SCSI system.

Sheldon
